## DIRECTOR GENERAL OF HEALTH MALAYSIA FORWARD MESSAGE

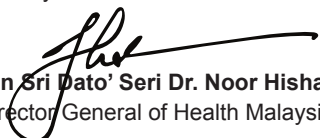

Ministry of Health is currently intensifying health care delivery as part of the Millennium Development Goals as there is a growing acknowledgement that optimal health care cannot be delivered by simply ensuring coexistence of infrastructure, medical supplies and health care providers. Strengthening our health care delivery requires a deliberate focus on quality of health services, which involves providing effective, safe, patient-centred care that is timely, equitable, integrated and efficient. There are three sub-disciplines in Anaesthesia and Intensive Care services, which are Anaesthesia (Anaesthesiologist Assistant - AA), Intensive Care Unit (Intensive Care Technologist - ICT) and Peri-anaesthesia (Anaesthetic Assistant and Technologist - AAT). This Standard Practice Guidelines (SPG) are prepared for AMO working in Anaesthesia and Intensive Care Services.

The SPG are aimed at providing useful information for quality patient management and I hope the guidelines will be used as primary source reference for AMO throughout the country in the execution of their duties and efforts to provide quality health care to the community. It is my sincere hope that this SPG endeavour AMO in clinical practice to move to greater heights. It also serves to enhance the quality standards management of patients by AMO in Anaesthesia and Intensive Care services.

I believe with the adoption of this first edition, the services rendered by AMO will be enhanced to its optimum level. It also will serve as a reference to those who are new in the field of anaesthesia and intensive care services. I am delighted as in this SPG, the role and responsibilities of AMOs are deliberately explained. In recognizing the competency of the AMOs in each subspecialty, credentialing already ongoing process, which has started on 2018. I am confident the SPG will be well accepted. We will ensure that updates with new emerging protocols, activities and procedures will be introduced in future editions in line with current practice.

I am always impressed with efforts to strive for excellence in service delivery and such efforts by the AMO in Anaesthesia and Intensive Care services are most commendable indeed. On behalf of the Ministry of Health, I would like to extend my distinguished congratulations to the Medical Practices Division, Assistant Medical Officers Services Section and esteemed Anaesthesiologists, as well as the AMO Technical Committee for their tireless efforts and commitment to publish the 1st Edition of Standard Practice Guidelines for AMO in Anaesthesia and Intensive Care services. My personal heart-warming appreciation tributes to AMO in Anaesthesia and Intensive Care services throughout the country who uphold high standard of professionalism in the execution of their duties in order to provide quality health care to the community. The Ministry of Health Malaysia takes special pride in the fraternity's continuous determination for excellence in service delivery to the nation.

  
**Tan Sri Dato' Seri Dr. Noor Hisham bin Abdullah**  
 Director General of Health Malaysia

## DIRECTOR MEDICAL PRACTICE DIVISION FORWARD MESSAGE

Throughout the years, the standard of practice among the Assistant Medical Officers in Anaesthesia and Intensive Care services under Ministry of Health has shown some great enhancement in clinical practice for the better management of patient care. It is noted many years back, as there were few reference documents available, these Assistant Medical Officer need to learn from their seniors through hands-on training with guidance of Anaesthesiologists and Intensivists to acquire knowledge and skills in providing good quality of patient care.

It is time to have a dedicated SPG for AMOs in Anaesthesia and Intensive Care services as it will provide a greater impact on the services and performance of AMO in their clinical settings. This SPG is very essential and relevant in the current practice of AMOs in Anaesthesia and Intensive Care services with the aim of having uniformity and standardization with consistency of practice in this discipline where performance of AMO could be strengthened. We believe with the adoption of this new SPG, the services rendered by AMO in Anaesthesia and Intensive Care services will be enhanced to its optimum level. It also will serve as a reference to those who are new in Anaesthesia and Intensive Care services.

It is our sincere hope that this new version of SPG would form part of an important document to be complied with by the AMO in providing better care to patients. It is noted the task in preparing the new edition is not an easy one, where it requires good leadership, teamwork, commitment, knowledge and dedication. With that, I would like to congratulate to those involved in developing this first edition of SPG for AMO in Anaesthesia and Intensive Care services and our heartfelt appreciation to them for their passion and endless effort.

**Dr. Mohamed Iqbal bin Hamzah**

Director

Medical Practice Division

## HEAD OF SERVICE FORWARD MESSAGE

The Anaesthetic and Intensive Care Service is arguably one of the biggest services in the hospitals. With increasing demands from the public and clinicians, the anaesthetic departments face many encounters in meeting these expectations. Clearly, there is a need for this critical service to be delivered in an efficient, structured and coordinated manner consistent with the vision and mission of the Ministry of Health. I believe that with this in mind, the idea of developing the Standard Practice Guideline (SPG) by Assistant Medical Officers Services Section was mooted. I would like to congratulate all those who have contributed by sharing their experience and knowledge during the preparation of SPG.

The first structured form of Anaesthesiology and Intensive Care Services by Assistant Medical Officer was published in 2007, which only cover roles of Assistant Medical Officers (AMO) in Anaesthesia (East Malaysia). Currently the new SPGs for AMO in Anaesthesia and Intensive Care services are formed is a written instruction of a particular procedure which consist of scope, purpose, materials or equipment, work process, references, flow chart and revision history. It is vital for AMO in Anaesthesia and Intensive Care services so that quality and uniformity is maintained all times. Therefore, it is necessary for AMO to adhere to the SPG while carrying out their duties.

I believe this first edition of SPG for Assistant Medical Officer in Intensive Care Unit (Intensive Care Technologists – ICT) and Peri-anaesthesia (Anaesthetic Assistant and Technologist - AAT) will provide a greater impact on the services and performance of AMO. This SPG is very essential and relevant in the current practice of AMO in anaesthesia and intensive care services with the aim of having uniformity and standardization with consistency of practice in this discipline where performance of AMO could be strengthened.

This SPG will also benefit AMO managers in formulating local hospital policies and procedures, coordinating interdepartmental collaboration, and planning for facilities and service development, thereby ensuring that available resources are utilised optimally. This handbook is excellent as a guide to all AMO in Anaesthesia and Intensive Care service who are learning as well as for those already active in the practice.

Overall, I hope that this book will be very useful for all AMO and I would like to take this opportunity to express my gratitude to all of the contributors for their outstanding work and hope this SPG will be a useful reference for all AMO. Lastly, I would like to thank Medical Practices Division, Assistant Medical Officers Services Section and esteemed Anaesthesiologists, as well as the AMO Technical Committee for their tireless efforts and commitment to publish the 1st Edition of Standard Practice Guidelines for AMO in Anaesthesia and Intensive Care Service

**Dr. Zalina binti Abdul Razak**

Head of National Anaesthesiology Services and Senior Consultant Anaesthesiologist Head of Department.

Department of Anaesthesiology & Intensive Care Hospital Kuala Lumpur

## HEAD OF ASSISTANT MEDICAL OFFICER MESSAGE

Despite many achievements of our healthcare delivery system in the past and present, an increasingly expectancy on better services from our Assistant Medical Officers (AMO) from public continues. Clearly, there is still much room to improve AMO services. Better approaches and processes for the delivery of hospital-based services have to be articulated and implemented, and we should have the fortitude and courage to put planned approaches into action.

We also need to ensure that proper structures are put in place in our hospitals that are acceptable, evidence-based, outcome-oriented, quality driven, practical, and above all suit the needs and benefits of our patients in order to meet the requirement of AMO Professional Development Plan (6P) 2016-2030 by Assistant Medical Officers Services Section. Having a well-documented SPG for AMO in Anaesthesia and Intensive Care service as this will help to ensure that services are executed efficiently, while utilising existed resources. SPG shall be among our strategies to improve the AMO services in Anaesthesia and Intensive Care, apart from measures like infrastructural and human capital development.

This SPG will achieve uniformity, standardization, correctness, accuracy and effectiveness as well consistency in performance and competency of AMO in Anaesthesia and Intensive Care service. Hence, compliance to SPG would ensure patient's safety in accordance to Ministry Of Health policies and guidelines. Developing this SPG, I am sure, this is a challenging task to the committee. It requires a great depth of knowledge, consistency, team approach and the courage to decide on what should constitute standard methods. I deeply indebted to the esteemed Anaesthesiologists, Intensivist and AMO Technical Committee of Anaesthesia and Intensive Care service for their indefatigable efforts upon completion of this SPG. I would like to express my gratitude to the Anaesthesia and Intensive Care fraternity for their involvement in producing of this new format of SPG.

I once again congratulate the AMO Technical Committee of Anaesthesia and Intensive Care service to be the first clinical discipline to develop and publish such a comprehensive document which consists of scope, purpose, materials, equipment, work process, references, flow chart and revision history.

Warm regards,

**Zulhelmi bin Abdullah**

## ACKNOWLEDGEMENT

The Committee of the Standard Practice Guidelines (SOP) wish to express its appreciation and thanks to the individuals for their invaluable contribution towards this second edition of the SOP:

1. The Director General of Health, Malaysia.
2. The Deputy Director General of Health (Medical).
3. The Director of Medical Development Division, MOH.
4. The Director of Medical Practice Division, MOH.
5. The Technical Advisors of SPG.
6. All Senior Consultant Anaesthesiologists, MOH.
7. Head of National Anaesthesiology Services.
8. The Members of Technical Committee.
9. The Panel of Reviewers.
10. The Panel of Contributors.
11. Assistant Medical Officer Service Section.
12. Malaysian Society of Anaesthesiology for Nurses and Assistant Medical Officers (MSANAMO).
13. All other colleague individuals and organization who have contributed directly or indirectly towards the success of this publication.

**FLOW CHART MANAGEMENT OF TRANSPORTATION  
CRITICALLY ILL PATIENT**

**A.3. REPROCESSING AND PREPARATION OF BAG VALVE MASK DEVICE**

<b>Scope</b>	Assistant Medical Officers are responsible in reprocessing (according to hospital infection control guidelines) and preparation of BVM to ensure it is functioning well before use on patient.
<b>Purpose</b>	To ensure BVM functioning well and safe to use on patient.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Bag valve mask device.</li> <li>3. Oxygen tubing.</li> <li>4. Storage container.</li> <li>5. Transparent plastic bag.</li> <li>6. HLD.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Cleaning: <ol style="list-style-type: none"> <li>i. hand hygiene.</li> <li>ii. wear an appropriate PPE.</li> <li>iii. dismantle the bag valve mask parts</li> <li>iv. ensure all parts are complete.</li> <li>v. check the valves and reservoir bag are intact.</li> <li>vi. wash all the BVM parts thoroughly with running water before soaking in the HLD solution.</li> <li>vii. rinse in sterile water and dry it in drying cabinet.</li> </ol> </li> <li>2. Assemble: <ol style="list-style-type: none"> <li>i. ensure all parts are assemble according to manufacturer operating manual: <ul style="list-style-type: none"> <li>- face mask.</li> <li>- expiratory valve.</li> <li>- pressure relief valve.</li> <li>- self-inflating bag.</li> <li>- air-inlet and pressure release valves.</li> <li>- air-inlet one-way valve.</li> <li>- reservoir bag.</li> </ul> </li> </ol> </li> </ol>

<p><b>Work Process</b></p>	<p>3. Function test:</p> <ol style="list-style-type: none"><li>i. ensure all accessories attached to BVM.</li><li>ii. self-inflating bag:<ul style="list-style-type: none"><li>- squeeze the BVM with one hand and close neck opening with the other hand.</li><li>- release the grip on the bag.</li><li>- rapid bag re-expansion confirms the efficient air intake.</li><li>- close the neck opening and squeeze the bag.</li><li>- If the bag cannot be squeezed with reasonable force, it is evidence of no leakage at air-inlet one-way valve.</li></ul></li><li>iii. attach the patient valve to the self-inflating bag to test the oxygen nipple:<ul style="list-style-type: none"><li>- squeeze the self-inflating bag.</li><li>- release it while closing the reservoir valve.</li><li>- slow re-expansion of the bag observed and it confirmed the oxygen nipple is intact.</li></ul></li><li>iv. squeeze the self-inflating bag several times and inspect the lip valve opens during squeezing.</li><li>v. hold reservoir bag over the patient port connector then squeeze:<ul style="list-style-type: none"><li>- filling of the reservoir bag confirms that the patient valve efficiently directs air to the patient.</li></ul></li><li>vi. reservoir bag:<ul style="list-style-type: none"><li>- held firmly to the valve connector.</li><li>- continue squeezing while watching the external disk membrane.</li><li>- lifting of the disk membrane confirms that air is correctly directed to atmosphere instead of being returned to the self-inflating bag.</li></ul></li></ol>
----------------------------	--

## vii. reservoir flap valves:

- attach patient valve to the reservoir bag.
- fill the bag with ambient air.
- attach reservoir bag to the intake valve and press on reservoir bag.
- squeeze the reservoir bag and visual rise of the outlet flap valve as it confirms the reservoir valve efficiently vents excessive gas to atmosphere.
- with the patient valve in place, attach the reservoir assembly to the intake valve.
- perform several compression-release cycles on the self-inflating bag until reservoir bag is flat and empty.
- rapid re-expansion of the self-inflating bag after flattening of the reservoir bag and visual movement of the inlet membrane confirm the reservoir valve efficiently lets in ambient air to compensate for lack of gas in the reservoir or insufficient gas flow through oxygen tubing and nipple.

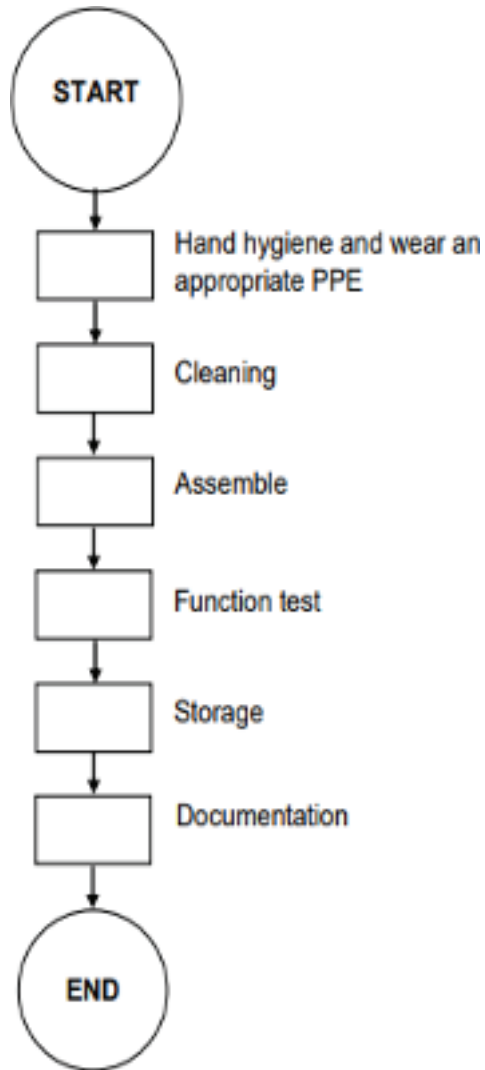

## 4. Storage:

- i. store in storage container or transparent plastic bag for the next patient use.

## 5. Documentation.

**FLOW CHART REPROCESSING AND PREPARATION OF  
BAG VALVE MASK DEVICE**

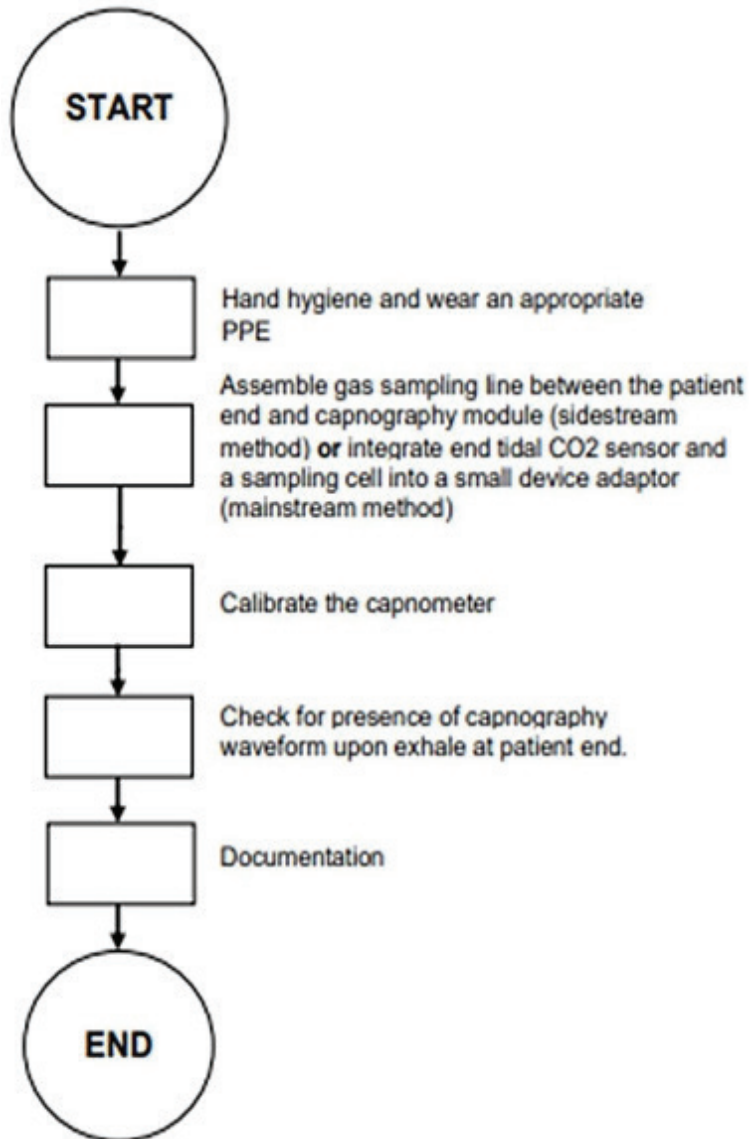

**A.4. PREPARATION AND SETTING UP OF CAPNOGRAPHY MONITORING**

<b>Scope</b>	Assistant Medical Officers are responsible to facilitate measurement and monitoring of patient's end tidal carbon dioxide concentration using graphic and numeric display.
<b>Purpose</b>	To provide continuous and instantaneous measurement of physiologic information on ventilation and be able to identify potential breathing complications (airway obstruction, hyperventilation, hypoventilation or apnoea).
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Gas sampling line (150cm to 200cm in length).</li> <li>3. Capnography module (main-stream or side-stream).</li> <li>4. Capnometer (with display of end tidal carbon dioxide waveform and numeric).</li> <li>5. Water trap.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. Wear an appropriate PPE.</li> <li>3. Assemble gas sampling line between the patient end and capnography module.</li> <li>4. For mainstream method, end tidal CO<sub>2</sub> sensor and a sampling cell are integrated into a small device adaptor that connects directly at the airway between the breathing circuit and ETT.</li> <li>5. Calibrate the capnometer (follow manufacturer's recommendations).</li> <li>6. Check for presence of capnography waveform upon exhale at patient end.</li> <li>7. Documentation: <ol style="list-style-type: none"> <li>i. document any related information and inform MO or specialist if any abnormalities observed.</li> </ol> </li> </ol>

## FLOW CHART PREPARATION AND SETTING UP CAPNOGRAPHY MONITORING

**A.5. PREPARATION AND SETTING UP OF PRESSURE TRANSDUCER SYSTEM**

<b>Scope</b>	Assistant Medical Officers are responsible to assist in preparation of pressure transducer system on critically ill patients that requires close monitoring in ICU.
<b>Purpose</b>	To provide MO or specialist with real-time access to their patient's haemodynamic and cardiovascular status in anaesthesia and intensive care settings.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. Physiological monitoring system with IBP capability.</li> <li>2. Pressure transducer kit.</li> <li>3. Non-compressible rigid-walled, fluid filled tubing, length of 150-200cm.</li> <li>4. Transducer cable – interface connection with physiological monitor.</li> <li>5. Normal Saline 0.9% 500ml.</li> <li>6. Pressure infusion bag (500ml) at 300mmHg - automated slow infusion (1-3ml/hr) of pressurized saline (exclude for ICP).</li> <li>7. IV pole (if applicable).</li> <li>8. Transducer holder (attach to IV pole).</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Wear an appropriate PPE.</li> <li>2. Preparation of the equipment.</li> <li>3. Set up the kit: <ol style="list-style-type: none"> <li>i. prepare the pressure infusion bag and transducer system (exclude for ICP).</li> <li>ii. open the pre-packed pressure transducer kits, using aseptic technique. <ul style="list-style-type: none"> <li>- single-pressure tubing kit for arterial monitoring.</li> <li>- double-pressure tubing kit can be used for CVP and arterial monitoring.</li> <li>- double-pressure tubing kit can be used for CVP and arterial monitoring.</li> </ul> </li> <li>iii. ensure all connections are tight.</li> <li>iv. invert the N/Saline bottle.</li> <li>v. spike the outlet port of the N/Saline bottle with the pressure tubing, keeping the drip chamber upright.</li> </ol> </li> </ol>

**Work  
Process**

4. Insert the N/Saline into the pressure bag (exclude for ICP) and hang it on the IV pole.
5. Flush the entire system, including the transducer, stopcock, and pressure tubing, with the flush solution.
6. Replace the vented cap on the stopcock with a non-vented cap.
7. Connecting the IV tubing to a pressure infusion bag of N/ Saline.
8. Inflate the pressure infusion bag to 300mmHg (exclude for ICP).
9. Monitor setup:
  - i. turn on the physiologic monitor.
  - ii. plug the pressure cables into the appropriate pressure modules or jacks in the bedside monitor.
  - iii. some monitors are pre-programmed to display the waveform that corresponds to the module or jack (e.g., first position, arterial; second position, PA; third position, RA).
  - iv. select the desired waveform label.
10. Level the arterial line at the phlebostatic axis.
11. Attach the transducer into the pole mount transducer holder.
12. Calibrate the transducer:
  - i. suspend the monitor alarms.
  - ii. turn off the three-way stop cock connector tap at the transducer. This blocks all pressure readings from the patient.
  - iii. remove the cap.
  - iv. select the "ART or ABP" parameter display on the monitor.
  - v. press the "Zero" icon.
  - vi. flattened pressure waveform will be appear and the pressure value will be seen to return to '0'.
  - vii. turn off to air the three-way stop cock at the transducer, replace the red cap and turn on towards the patient.
  - viii. the pressure waveform and values will reappear on the monitor.
13. Observe limb perfusion distal to the insertion site especially when withdrawing blood or flushing the cannula.

<p><b>Work Process</b></p>	<p>14. Ensure the pressure transducer system are well secured at a secondary anchorage point to reduce the risk of accidental removal.</p> <p>15. Pressure transducer system needs to be re-calibrated upon disconnection of patient.</p> <p>16. Continuous monitoring the pressure transducer waveform and troubleshoot if needed.</p> <p>17. Documentation.</p>

## FLOW CHART OF PRESSURE TRANSDUCER SYSTEM

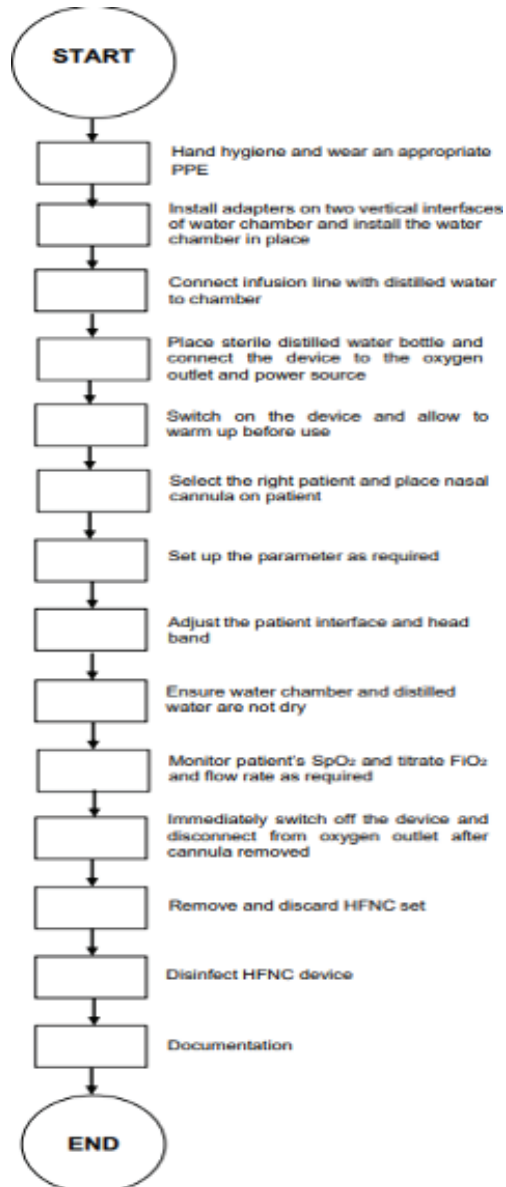

## A.6 PREPARATION AND REPROCESSING OF HIGH FLOW NASAL CANNULA DEVICE

<b>Scope</b>	Assistant Medical Officers are responsible in preparation and reprocessing of HFNC device according to hospital infection control guidelines and perform troubleshooting according to manufacturer protocols.
<b>Purpose</b>	To accomplish reduction of nasopharyngeal airway resistance, leading to improved ventilation and oxygenation through the application of a positive pressure environment.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. HFNC.</li> <li>3. Disinfection wipes.</li> <li>4. Humidifier chamber.</li> <li>5. Heated inspiratory circuit.</li> <li>6. Nasal Cannula.</li> <li>7. Sterile distilled water 500ml (IV bottle).</li> <li>8. Physiological Monitoring System.</li> <li>9. Oxygen flow meter and tubing.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Pre-use:             <ol style="list-style-type: none"> <li>i. hand hygiene.</li> <li>ii. wear an appropriate PPE.</li> <li>iii. install adapters on two vertical interfaces of water chamber according to the direction and press tightly with force.</li> <li>iv. install the water chamber in place.</li> <li>v. connect infusion line with distilled water to chamber.</li> <li>vi. sterile distilled water bottle must run freely and be placed high above the humidifier to achieve free flow of water into the humidifier.</li> <li>vii. connect the device to the oxygen outlet and power source.</li> <li>viii. switch on the device and allow to warm up before use.</li> <li>ix. select the right mode with the right category of patient (adult or paediatric).</li> <li>x. place nasal cannula on patient;                 <ul style="list-style-type: none"> <li>- ensure cannula sit snugly in the patient's nares</li> </ul> </li> <li>xi. set up the parameter as required.</li> </ol> </li> </ol>

<p><b>Work Process</b></p>	<ol style="list-style-type: none"> <li>2. Intra-use:             <ol style="list-style-type: none"> <li>i. the patient interface and head band are adjusted, so that the patient feels comfortable.</li> <li>ii. always ensure that the water chamber and distilled water bottle are not dry.</li> <li>iii. monitor patient's SpO2 status.</li> <li>iv. titrate FiO2 and flow rate as required.</li> </ol> </li> <li>3. Post-use:             <ol style="list-style-type: none"> <li>i. once cannula is removed, immediately switch off the device.</li> <li>ii. disconnect from oxygen outlet.</li> <li>iii. remove and discard HFNC set.</li> <li>iv. disinfect HFNC device as per manufacturer disinfection guideline.</li> </ol> </li> <li>4. ## FLOW CHART MANAGEMENT OF HIGH FLOW NASAL CANULA

### A.7. PREPARATION AND REPROCESSING OF POWERED AIR PURIFYING RESPIRATOR

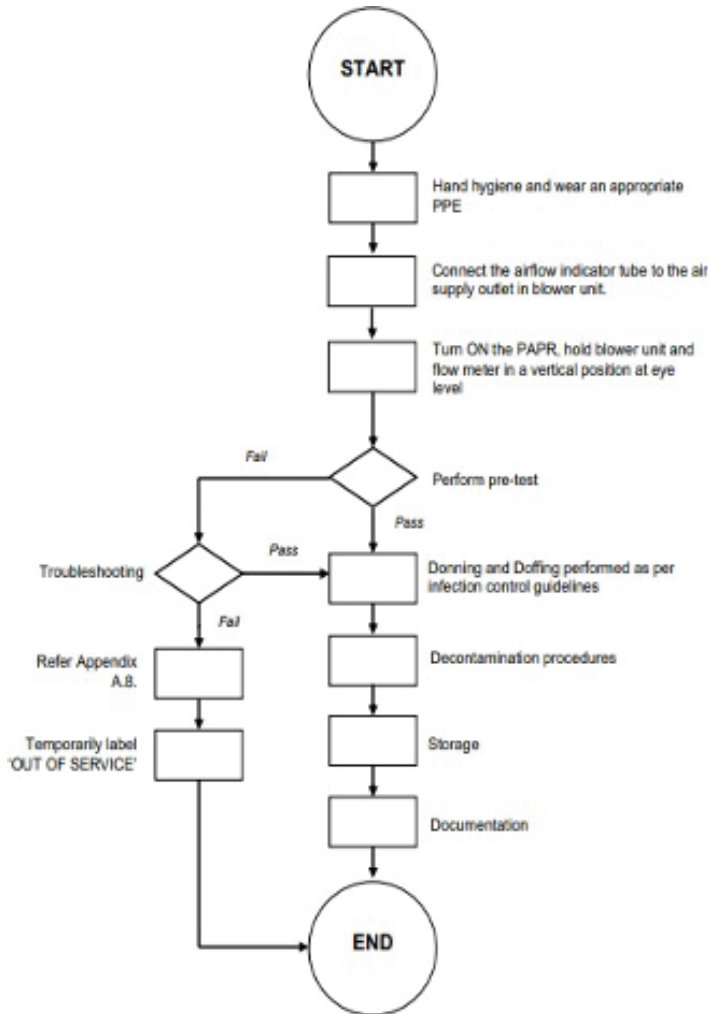

<b>Scope</b>	Assistant Medical Officers are responsible to management and reprocessing of PAPR device according to hospital infection control guidelines.
<b>Purpose</b>	To safeguard HCW against contaminated air or during performing high-risk aerosol generating procedures.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Filtering face piece respirator or N95 mask.</li> <li>3. Face piece or visor or long hood.</li> <li>4. Hose.</li> <li>5. HEPA filter.</li> <li>6. Blower unit.</li> <li>7. Battery pack (power source).</li> <li>8. Waist band.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. Wear an appropriate PPE.</li> <li>3. Connect the airflow indicator tube to the air supply outlet in blower unit.</li> <li>4. Turn ON the PAPR.</li> <li>5. Hold blower unit and ensure flow meter in a vertical position at eye level (follow the manufacturer's recommendations).</li> <li>6. Perform pre-test as recommended by manufacturer. Do not use the PAPR if test failed and refer to Appendix A.8.</li> <li>7. Donning and doffing are performed as per infection control guidelines.</li> <li>8. Consideration for filter change, if:             <ol style="list-style-type: none"> <li>i. there is airflow blockage alarm either by sound alarm or change in the colour.</li> <li>ii. visibly dirty, wet, damaged or bad odour.</li> <li>iii. the device does not pass the airflow test even with a fully charged battery.</li> <li>iv. after 30 days from initial use as per manufacturer recommendation.</li> </ol> </li> </ol>

<b>Work Process</b>	<p>9. Decontamination procedures:</p> <ol style="list-style-type: none"><li>i. while wearing gloves, disconnect all component parts of PAPR; battery pack, breathing hose and head hood from the blower unit.</li><li>ii. inspect all parts for any damage.</li><li>iii. clean the external surfaces with HLD spray (head-hood, blower unit, battery pack).</li><li>iv. replace the plastic cover of breathing hose after each use and immersed in water for cleaning if visibly dirty or contaminated.</li><li>v. disinfect all component parts by using antimicrobial wipes.</li><li>vi. do not spray the blower unit directly.</li><li>vii. do not clean cartridges or filters.</li><li>viii. wipe the interior part of the hood with an antimicrobial wipe.</li><li>ix. allow air dry for the blower unit, breathing hose, battery pack, and hood or helmet.</li></ol> <p>10. Storage:</p> <ol style="list-style-type: none"><li>i. store in a clean, contaminant free environment, protected from prolonged exposure to heat, sunlight, radiation and chemicals.</li><li>ii. the motor or blower should be run at least once per year for 5 minutes to ensure continued proper lubrication of the motor according to manufacturer recommendations.</li><li>iii. PAPR filters should not be stored long-term in the motor or blower as this may damage the filter gasket.</li><li>iv. the battery must be charged after each use.</li><li>v. recharge the battery pack.</li></ol> <p>11. Documentation.</p>

**FLOW CHART DECONTAMINATION OF ANAESTHETIC MACHINE, EQUIPMENT AND  
PHYSIOLOGIC MONITORS**

**B.2. CHECKING GENERAL ANAESTHETIC MACHINE**

<b>Scope</b>	Assistant Medical Officers are responsible in checking GA machine.
<b>Purpose</b>	To ensure GA machine is in fully functioning for safe delivery of anaesthesia.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. PPE.</li> <li>3. Anaesthetic machine with ventilator and alarm system.             <ol style="list-style-type: none"> <li>i. gases:                 <ul style="list-style-type: none"> <li>- central supply – 58.01 psig (4 bar)                     <ul style="list-style-type: none"> <li>• O<sub>2</sub>.</li> <li>• N<sub>2</sub>O.</li> <li>• medical air.</li> </ul> </li> <li>- cylinders:                     <ul style="list-style-type: none"> <li>• O<sub>2</sub> – 0.7 m<sup>3</sup>.</li> <li>• N<sub>2</sub>O – 0.7 m<sup>3</sup>.</li> <li>• cylinder keys.</li> </ul> </li> <li>- breathing circuit system.</li> <li>- test lung.</li> </ul> </li> <li>ii. flowmeters:                 <ul style="list-style-type: none"> <li>- O<sub>2</sub>.</li> <li>- N<sub>2</sub>O.</li> <li>- air.</li> </ul> </li> <li>iii. vaporisers:                 <ul style="list-style-type: none"> <li>- sevoflurane.</li> <li>- desflurane.</li> </ul> </li> <li>iv. breathing system - circle circuit.</li> </ol> </li> <li>4. AGSS.</li> <li>5. Documentation             <ol style="list-style-type: none"> <li>i. record book - GA machine check list</li> </ol> </li> </ol>

<b>Work Process</b>	<p>Level One:</p> <ul style="list-style-type: none"> <li>- performed by trained service personnel, of all systems before being placed into use. This applies to all new systems, as well as all systems after servicing or repair.</li> </ul> <p>Level Two</p> <ul style="list-style-type: none"> <li>- performed at the start of each anaesthetic list.</li> </ul> <p>Level Three</p> <ul style="list-style-type: none"> <li>- performed before commencing anaesthesia for each patient.</li> </ul>
	<ol style="list-style-type: none"> <li>1. Power supply:       <ol style="list-style-type: none"> <li>i. plugged in to uninterrupted power supply (UPS).</li> <li>ii. switch on.</li> <li>iii. back-up battery charged.</li> </ol> </li> <li>2. Gases       <ol style="list-style-type: none"> <li>i. check O<sub>2</sub>, N<sub>2</sub>O and medical air supply:           <ul style="list-style-type: none"> <li>- central supply:               <ul style="list-style-type: none"> <li>• check central supply gas warning light.</li> <li>• correctly connected with tug test.</li> <li>• pressure gauge shown pressure @ ± 4 bar.</li> </ul> </li> <li>- cylinder supply:               <ul style="list-style-type: none"> <li>• disconnect central supply to the machine.</li> <li>• ensure:                   <ul style="list-style-type: none"> <li>- the pressure is appropriate.</li> <li>- the cylinder can be turned on and off.</li> <li>- the content is sufficient.</li> <li>- no leak.                       <ul style="list-style-type: none"> <li>• after completing the checks, turn off cylinder.</li> </ul> </li> </ul> </li> <li>- test warning device on O<sub>2</sub> failure.</li> <li>- with N<sub>2</sub>O and O<sub>2</sub> flowing at 2 l/min, disconnect O<sub>2</sub> supply.</li> <li>- press O<sub>2</sub> bypass button to release O<sub>2</sub> pressure in machine.               <ul style="list-style-type: none"> <li>• ensure:</li> </ul> </li> </ul> </li> </ul></li></ol> </li> </ol>

**Work  
Process**

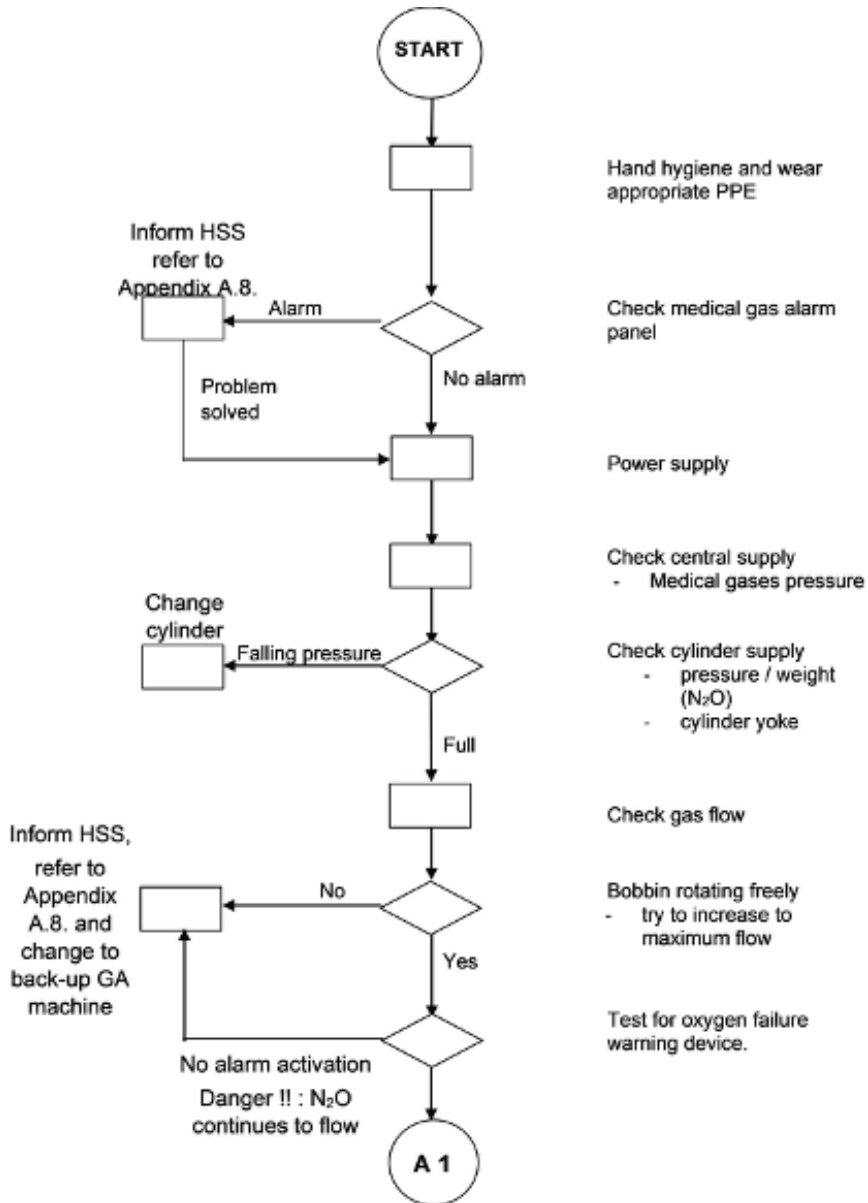

- the pressure is appropriate.
  - the cylinder can be turned on and off.
  - the content is sufficient.
  - no leak.
    - after completing the checks, turn off cylinder.
  - test warning device on O<sub>2</sub> failure.
  - with N<sub>2</sub>O and O<sub>2</sub> flowing at 2 l/min, disconnect O<sub>2</sub> supply.
  - press O<sub>2</sub> bypass button to release O<sub>2</sub> - pressure in machine.
    - one gas test for anaesthetic machine (to eliminate possibility of crossed pressure hoses).
  - calibrate O<sub>2</sub> sensor when indicated.
3. Flowmeters:
- i. ensure that flowmeter bobbins rotate freely within the column.
  - ii. turn off each flowmeter control and see O<sub>2</sub> flowmeter bobbin is at the minimum position (200-300 ml/min).
  - iii. verify the function of the O<sub>2</sub> supply failure warning and associated anti-hypoxic delivery system.
4. Vaporiser:
- i. ensure electricity is connected to vaporisers that required.
  - ii. check the level of inhalation agent.
  - iii. ensure:
    - all filling ports are sealed.
    - correct seating, locking and interlocking of detachable vaporisers or cassettes.
  - iv. test for circuit leaks for each vaporiser in the “on” and “off” state.
  - v. check for machine leaks upstream from the common gas outlet or breathing system, using a protocol appropriate for the anaesthesia delivery system.

<p><b>Work Process</b></p>	<p>5. Breathing System:</p> <p>i. circle system:</p> <ul style="list-style-type: none"><li>- inspect the breathing system to be used.</li><li>- connect and commence the tests as below:<ul style="list-style-type: none"><li>• check the indicator colour of the carbon dioxide absorbent according to the manufacturer specifications.</li><li>• change when carbon dioxide absorbent 2/3 exhaustion or presence of CO<sub>2</sub> in rebreathing capnograph @ 5 mmHg.</li><li>• check the breathing system by closing APL valve to 30cmH<sub>2</sub>O at a gas flow of 300 ml/min for 5 second:<ul style="list-style-type: none"><li>○ as a guide, the system should maintain a test pressure &gt;30 cm H<sub>2</sub>O at a gas flow of 300 ml/min for 5 seconds.</li></ul></li><li>• test the integrity of the circle breathing system:<ul style="list-style-type: none"><li>○ connect a breathing bag to the patient Y- piece.</li><li>○ set an appropriate fresh gas flow and ventilate the breathing system manually using a hand bagging method.</li><li>○ observe inflation and deflation of the attached breathing bag, associated movement of visible unidirectional valves and feel the system has normal resistance and compliance.</li><li>○ at the conclusion of the test, check for easy spill through the adjustable pressure limiting valve by simultaneously squeezing the hand bag and breathing bag.</li></ul></li></ul></li><li>• check compliance for each new breathing system.</li></ul>
----------------------------	---

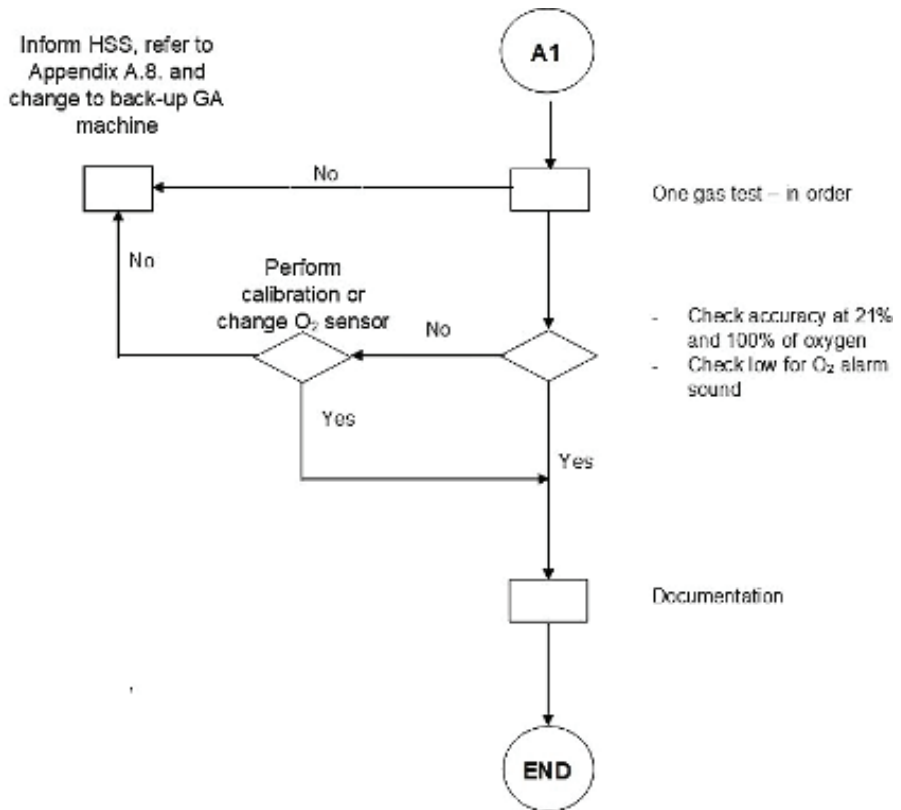

<b>Work Process</b>	<p>6. Scavenging system:</p> <ul style="list-style-type: none"> <li>i. the scavenging flow is adjusted appropriately.</li> <li>ii. ensure external ports or mechanical valves are not blocked.</li> </ul> <p>7. Other apparatus:</p> <ul style="list-style-type: none"> <li>i. HME.</li> <li>ii. BVF.</li> </ul> <p>8. Documentation.</p>
	<p><b>Level three check:</b></p> <ul style="list-style-type: none"> <li>- before starting anaesthesia for each patient.</li> </ul>
	<ul style="list-style-type: none"> <li>1. Check the inhalational anaesthesia delivery device (vaporiser) if it has been changed as in item No. 4.</li> <li>2. Check the breathing system if it has been changed as in item in No. 5.</li> <li>3. Check other apparatus as in item No. 7.</li> <li>4. Documentation of the level three check.</li> </ul>

**FLOW CHART ASSISTING IN EXTUBATION OF  
ENDOTRACHEAL TUBE**

**B.7. ASSISTING IN AWAKE FLEXIBLE BRONCHOSCOPE INTUBATION**

<b>Scope</b>	Assistant Medical Officers are responsible in assisting in AFBI procedure.
<b>Purpose</b>	To ensure safety of patient during procedure.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Flexible bronchoscope with monitor.</li> <li>3. Bronchoscope set.</li> <li>4. ETT or reinforced tube.</li> <li>5. Syringe: 5ml &amp; 10ml.</li> <li>6. Water for irrigation.</li> <li>7. Plain white gauze.</li> <li>8. Lignocaine 2% (non-preservative).</li> <li>9. Lidocaine spray.</li> <li>10. Atomizer or Mucosal Atomization Device (MAD) if available.</li> <li>11. Suction tubing.</li> <li>12. Airway: optional Berman Airway.</li> <li>13. Endoscopy mask.</li> <li>14. Nasal cannula.</li> <li>15. Catheter mount.</li> <li>16. Nebulizer mask.</li> <li>17. BPP.</li> <li>18. SSSL form.</li> <li>19. GA form.</li> </ol>

**Work Process**

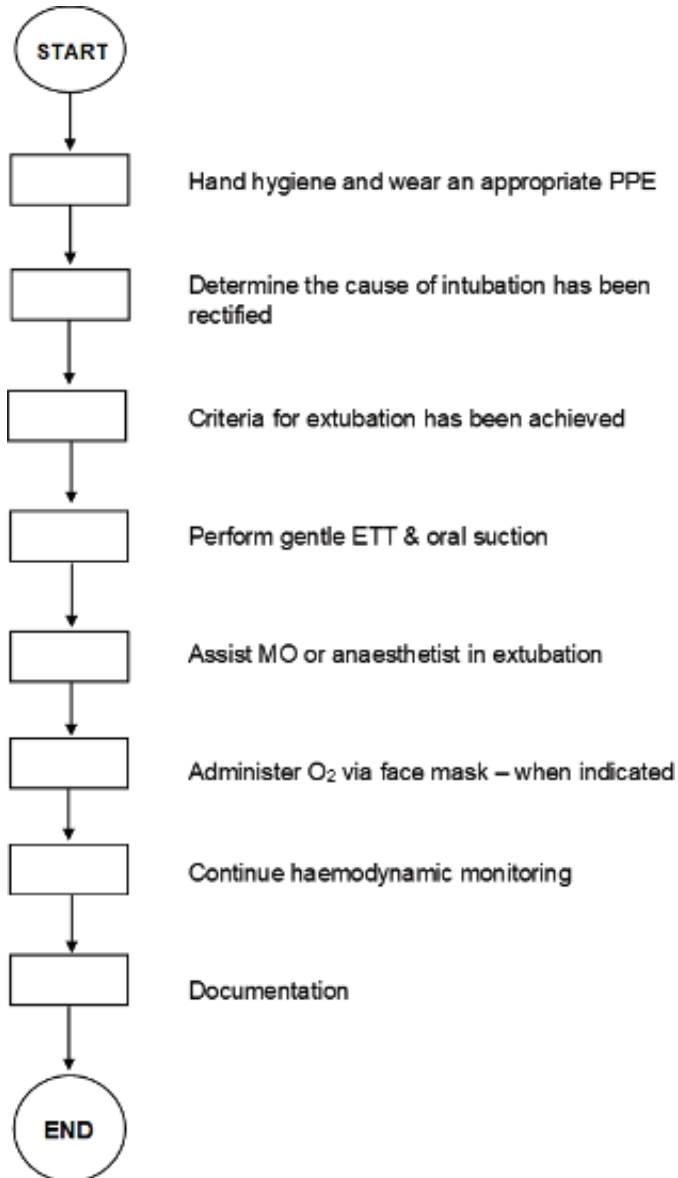

1. Hand hygiene.
2. Wear an appropriate PPE.
3. Preparation of patient:
  - i. determine route for AFBI (nasal or oral).
  - ii. explain to patient regarding AFBI procedure.
  - iii. adequate intravenous access for drugs administration and volume expansion.
  - iv. nebuliser 10ml of Lignocaine of 2% upon arrival.
4. Preparation of equipment:
  - i. layout equipment on trolley and maintain the sterility.
  - ii. prepare ETT according to patient or anaesthetist order, check for functionality and lubricate the cuff.
  - iii. check for functioning of the flexible bronchoscope and lubricate the shaft.
  - iv. pass the flexible bronchoscope through the ETT and secure it at the proximal of the flexible scope.
  - v. check and perform white balance (if required).
  - vi. prepare two gallipots, fill up one with water for irrigation, another one with 10ml of Lignocaine 2%.
  - vii. syringe out 3ml Lignocaine 2% for spray-as-you-go technique.
  - viii. connect suction tubing to suction port at the flexible bronchoscope.
5. Positioning of the patient
  - i. position patient according to anaesthetist order (sitting or supine).
  - ii. make patient comfortable.
  - iii. O<sub>2</sub> supplement via nasal cannula 2-3 l/min during procedure.
  - iv. continue monitoring patient.

**Work Process**

6. Assist Mo or anaesthetist in intubation
  - i. hand over flexible bronchoscope to anaesthetist.
  - ii. once anaesthetist visualized the vocal cord, assist anaesthetist as ordered.
  - iii. inflate the endotracheal tube cuff once in position.
  - iv. assist MO or anaesthetist to remove the flexible bronchoscope when required:
    - ensure the ETT is held securely during removal of the scope to prevent dislodgement.
    - ensure the tip of flexible bronchoscope is in neutral position.
  - v. connect catheter mount to ETT.
  - vi. secure ETT once placement confirmed.
  - vii. clean up flexible bronchoscope using gauze and flush out any secretion left in flexible bronchoscope using water for irrigation.
7. Documentation.
8. Cleaning of flexible bronchoscope.

**FLOW CHART ASSISTING IN RAPID SEQUENCE INTUBATION**

**B.9. ASSISTING IN SUPRAGLOTTIC AIRWAY DEVICE INSERTION**

<b>Scope</b>	Assistant Medical Officers are responsible in preparing and assisting in SGA device insertion.	
<b>Purpose</b>	To allow ventilation, oxygenation, anaesthetic gases. and administration of	
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Intubation equipment (MALES).</li> <li>3. SGA devices according to body weight of patient.</li> <li>4. Introducer: Proseal or flexible LMA.</li> <li>5. Syringe: 20ml.</li> <li>6. Lubricant gel.</li> <li>7. O2 supply.</li> <li>8. GA form.</li> <li>9. SSSL form.</li> </ol>	
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. Wear an appropriate PPE.</li> </ol>	
	<ol style="list-style-type: none"> <li>3. Final assessment.</li> <li>4. Final checking and preparation of machine.</li> <li>5. Preparation of anaesthetic drugs.</li> <li>6. Preparation of patient.</li> </ol>	Refer to relevant procedure
	<ol style="list-style-type: none"> <li>7. Preparation of SGA devices:             <ol style="list-style-type: none"> <li>i. selection of size – according to patient's body weight.</li> <li>ii. standby 1 size bigger and 1 size smaller.</li> <li>iii. deflate cuff with cuff deflator (where applicable).</li> <li>iv. ensure stiff wedge and wrinkle free.</li> <li>v. lubricate the posterior SGA surface.</li> <li>vi. SGA device incorporated with a gastric drainage tube placed lateral to the main airway tube and which ends at the tip of the mask - assemble with introducer to facilitate insertion (where applicable).</li> </ol> </li> </ol>	

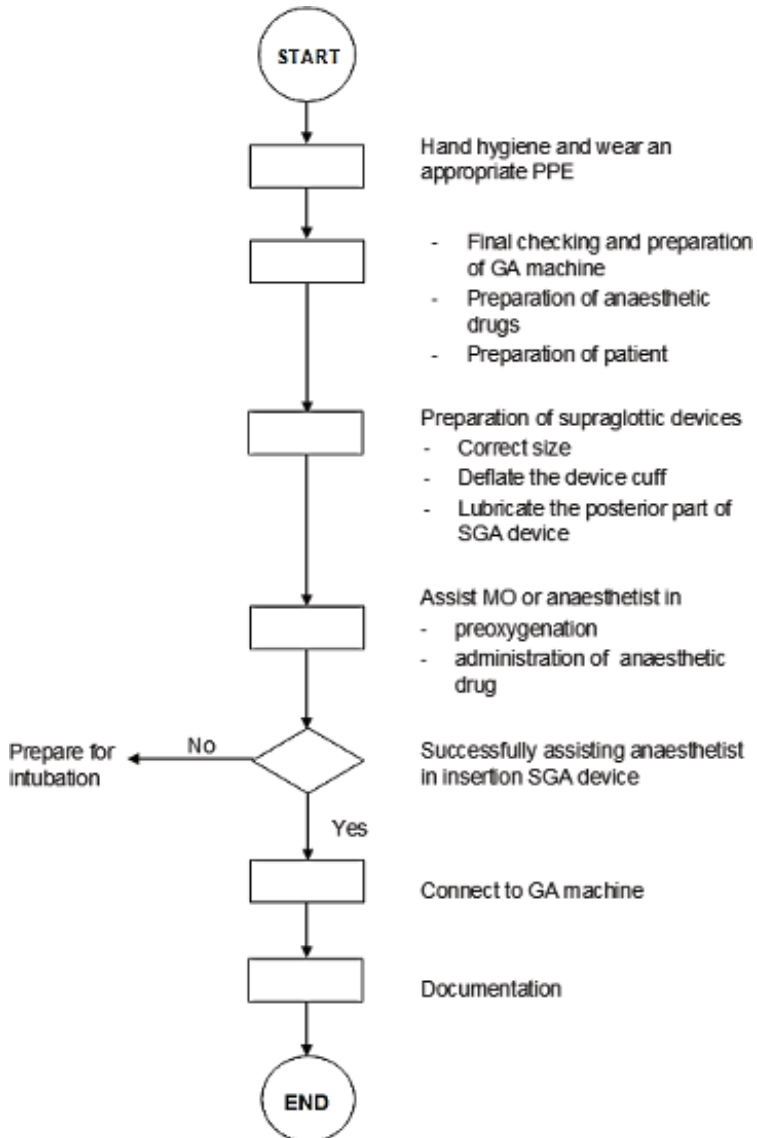

**Work Process**

8. Assist in preoxygenation:
  - i. place patient in sniffing position.
  - ii. keep suction machine on, ready for use.
  - iii. ask patient to inhale 4-8 vital capacity breaths with 100% O<sub>2</sub>.
  - iv. O<sub>2</sub> gas flow 8-10 l/min.
  - v. ensure SpO<sub>2</sub> above 98%.
9. Assist in the administration of anaesthetic drugs:
  - i. depth of anaesthesia must be adequate to ensure successful insertion.
10. Assist Mo or anaesthetist in the SGA device insertion:
  - i. stand at the patient's head end and place the patient in the sniffing position.
  - ii. ensure patient is unresponsive with relaxed jaw.
  - iii. insert the supraglottic device into hypopharynx and advanced posteriorly along the hard palate until resistant.
  - iv. procedure should not take more than 30 seconds.
  - v. inflate the cuff according to the size of the SGA device:
    - inflate cuff till no audible air leakage or at 45-60 cmH<sub>2</sub>O.
  - vi. Ventilate lungs manually:
    - observe chest expansion on each ventilation.
    - no abdominal distension.
    - confirm by capnograph and auscultation, listen for equal air entry in both lungs.
11. Secure the SGA device and connect to GA machine.
12. Documentation.

### B.12. ASSISTING IN THE NEURAXIAL I BLOCKADE (SPINAL OR EPIDURAL OR COMBINED SPINAL EPIDURAL) ANAESTHESIA PROCEDURES

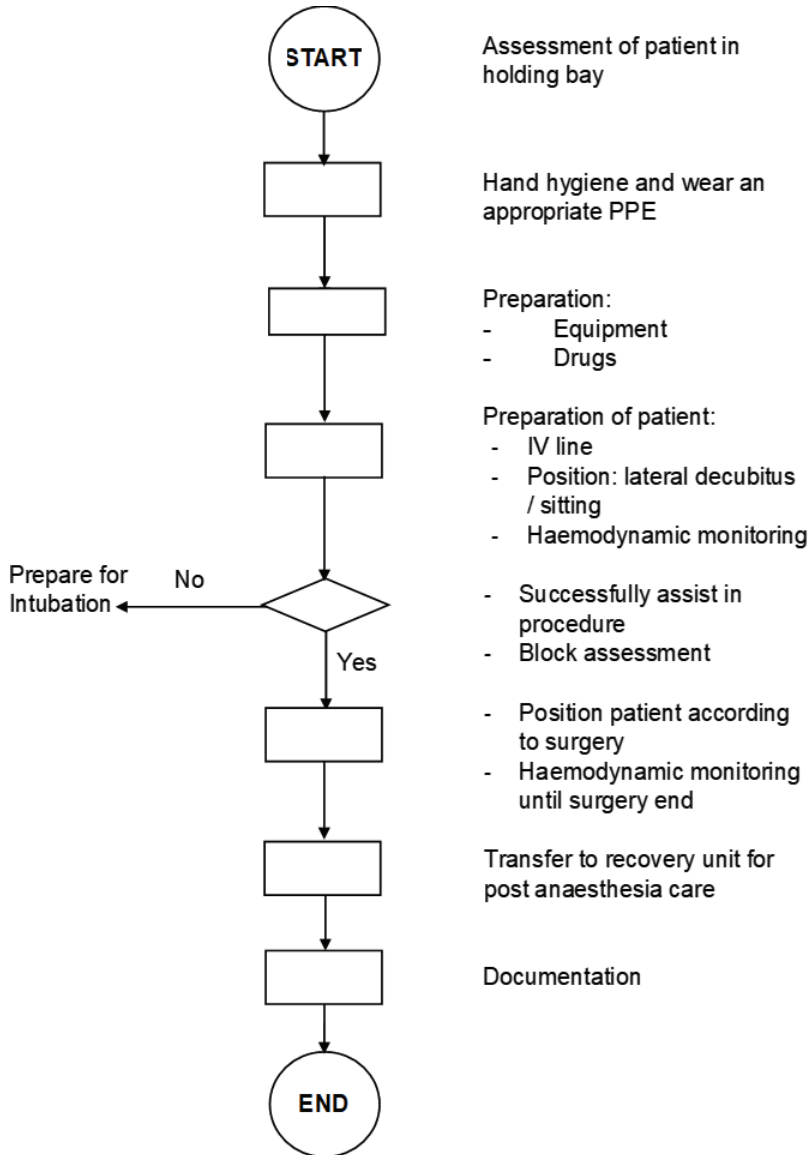

<b>Scope</b>	Assistant Medical Officers are responsible in preparing and assisting in the Neuraxial I Blockade (Spinal or Epidural or Combined Spinal Epidural) anaesthesia procedure.
<b>Purpose</b>	To ensure safety of patient and surgery under Neuraxial I Blockade take place.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. SSSL form.</li> <li>3. GA form.</li> <li>4. Surgical consent.</li> <li>5. Anaesthesia consent.</li> <li>6. High risk consent (where applicable).</li> <li>7. GA machine.</li> <li>8. Intubation trolley.</li> <li>9. Physiological monitoring system.</li> <li>10. IV cannulation set.</li> <li>11. Warming devices.</li> <li>12. Specific needles for different type of neuraxial blockade:             <ol style="list-style-type: none"> <li>i. SAB – pencil point or cutting needle (25G or 27G).</li> <li>ii. epidural anaesthesia – epidural set.</li> <li>iii. CSE – CSE set.</li> </ol> </li> <li>13. Drug:             <ol style="list-style-type: none"> <li>i. local anaesthetic drugs: Bupivacaine in Dextrose, Bupivacaine, Ropivacaine, Levobupivacaine.</li> <li>ii. opioids: Morphine, Fentanyl.</li> <li>iii. intubation drugs: Hypnotic agent, NMBA.</li> <li>iv. anticholinergic agent: Atropine.</li> <li>v. antisialagogue agent: Glycopyrrolate.</li> <li>vi. vasoconstrictor agent: Ephedrine, Phenylephrine.</li> <li>vii. emergency drugs: Adrenaline.</li> </ol> </li> <li>14. BPP.</li> <li>15. Spinal set.</li> </ol>

**Work Process**

1. Hand hygiene.
2. Wear an appropriate PPE.
3. Final assessment - refer to relevant procedure.
4. Management of OR before anaesthesia - refer to relevant procedure.
5. Preparation of equipment and drug:
  - i. according to procedure:
    - spinal set.
    - subarachnoid block – pencil point or cutting needle (25G or 27G).
    - epidural anaesthesia – epidural set.
    - CSE – CSE Set.
  - ii. drugs:
    - local anaesthetic drug:
      - SAB – Bupivacaine in Dextrose.
      - epidural anaesthesia: Bupivacaine, Levobupivacaine, Ropivacaine.
    - other drugs - as above.
6. Preparation of patient:
  - i. introduction and explanation.
  - ii. ensure IV line is functioning.
  - iii. assist in preloading patient with crystalloid.
  - iv. assemble physiological monitoring system and continuous monitoring.
  - v. positioning patient: sitting or lateral decubitus.
7. Assisting MO or anaesthetist in the procedure:
  - i. position patient according to surgery once procedure completed.
8. Allow surgery or procedure to proceed:
  - i. assist anaesthetist in performing the effectiveness of block with bromage score, cold test, and pin prick test.

<b>Work Process</b>	<p>9. Monitoring:</p> <ul style="list-style-type: none"> <li>i. continuous monitoring patient until surgery end.</li> <li>ii. observe for side effects and complications.</li> <li>iii. transfer to recovery unit once surgery end.</li> </ul> <p>10. Documentation.</p>

### B.13. ASSISTING IN THE NEURAXIAL II BLOCKADE (PERIPHERAL NERVE BLOCK) ANAESTHESIA PROCEDURE

<b>Scope</b>	Assistant Medical Officers are responsible in preparing and assisting in Neuraxial II Blockade (Peripheral Nerve Block) anaesthesia procedure.
<b>Purpose</b>	To ensure safety of patient and surgery under Neuraxial II Blockade (Peripheral Nerve Block).
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. GA machine.</li> <li>3. SSSL form.</li> <li>4. Surgical consent.</li> <li>5. Anaesthesia consent.</li> <li>6. High risk consent (where applicable).</li> <li>7. Intubation trolley.</li> <li>8. Physiological monitoring system.</li> <li>9. IV cannulation set.</li> <li>10. Warming devices.</li> <li>11. Specific needles for different type of neuraxial II blockade.</li> <li>12. Ultrasound machine.</li> <li>13. Sterile ultrasound gel.</li> <li>14. Train of Four (TOF) machine.</li> <li>15. Drug:             <ol style="list-style-type: none"> <li>i. local anaesthetic drugs: Bupivacaine, Ropivacaine, Levobupivacaine.</li> <li>ii. opioids: Morphine, Fentanyl.</li> <li>iii. intubation drugs: Hypnotic agent, NMBA.</li> <li>iv. anticholinergic agent: Atropine.</li> <li>v. antisialagogue agent: Glycopyrrolate.</li> <li>vi. vasoconstrictor agent: Ephedrine, Phenylephrine.</li> <li>vii. emergency drugs: Adrenaline, Midazolam.</li> </ol> </li> <li>16. Sterile ultrasound probe cover.</li> <li>17. BPP.</li> </ol>

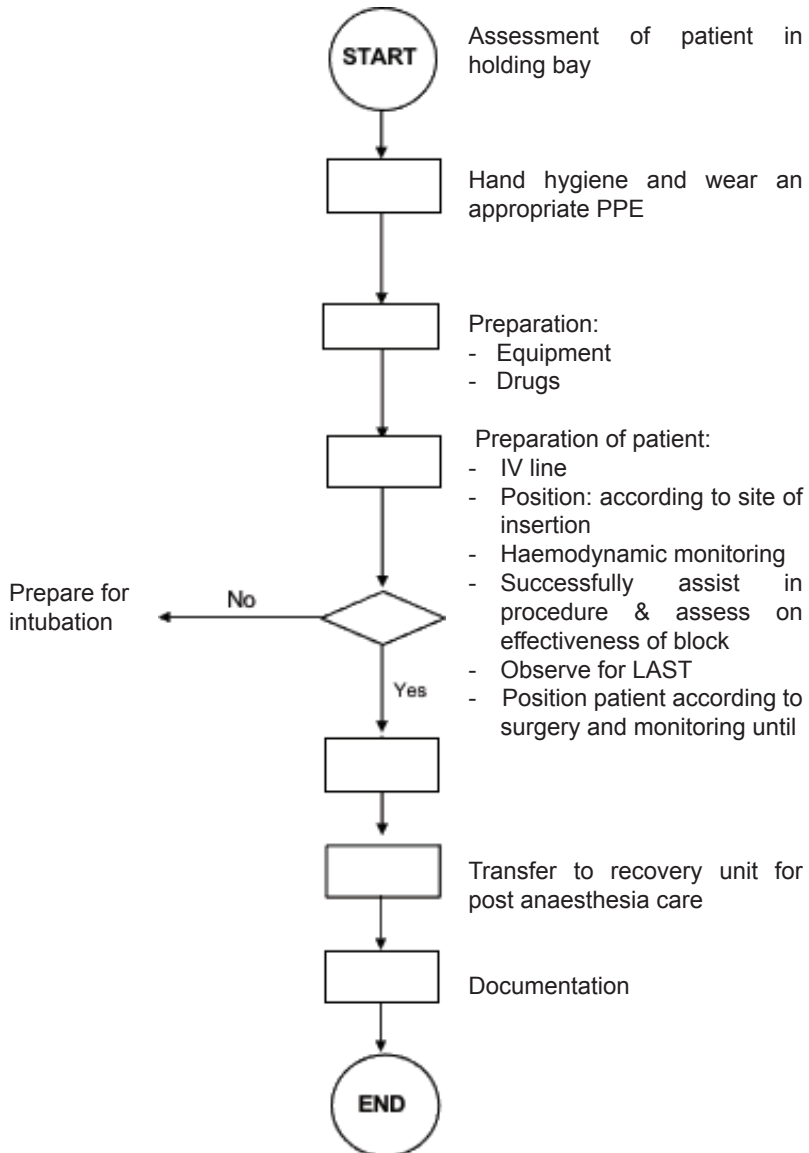

**Work Process**

1. Hand hygiene.
2. Wear an appropriate PPE.
3. Final assessment - refer to relevant procedure.
4. Management of OR before anaesthesia - refer to relevant procedure.
5. Preparation of equipment and drug:
  - i. according to site of peripheral nerve block:
    - upper limb.
    - lower limb.
  - ii. drugs:
    - local anaesthetic drug:
      - Bupivacaine, Levobupivacaine, Ropivacaine.
      - Other drugs – as above.
6. Preparation of patient:
  - i. introduction and explanation.
  - ii. ensure IV line is functioning.
  - iii. assemble physiological monitoring system and continue monitoring.
  - iv. positioning patient: according to site of insertion.
  - v. O<sub>2</sub> therapy – where applicable.
7. Assisting anaesthetist in the procedure:
  - i. continue haemodynamic monitoring.
  - ii. position patient according to surgery once procedure completed.
8. Allow surgery or procedure to proceed:
  - i. assist anaesthetist in performing the procedure.
  - ii. assist in performing test for block effectiveness.
  - iii. observe for signs and symptoms of LAST.
9. Monitoring:
  - i. continue physiological monitoring system until surgery end.
  - ii. observe for side effects and complications.
  - iii. transfer to recovery unit once surgery end.
10. Documentation.

**FLOW CHART ASSISTING IN NEURAXIAL II BLOCKADE  
(PERIPHERAL NERVE BLOCK) PROCEDURE**

**B.14(a). ASSISTING IN ONE LUNG VENTILATION  
(Double Lumen Endotracheal Tube)**

<b>Scope</b>	Assistant Medical Officers are responsible in the preparation and assisting in one lung ventilation.
<b>Purpose</b>	To allow ventilation of only one lung, while the other lung is compressed by the surgeon or allowed to passively deflate.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. SSSL form.</li> <li>3. GA form.</li> <li>4. Surgical consent.</li> <li>5. Anaesthesia consent.</li> <li>6. High risk consent (where applicable).</li> <li>7. GA machine.</li> <li>8. Physiological monitoring system.</li> <li>9. Intubation trolley with the following:             <ol style="list-style-type: none"> <li>i. double lumen ETT.</li> <li>ii. syringe – according to the choice of ETT.</li> <li>iii. spencer well artery forceps.</li> </ol> </li> <li>10. Flexible bronchoscope – sterile preparation:             <ol style="list-style-type: none"> <li>i. upper shelf:                 <ul style="list-style-type: none"> <li>- flexible bronchoscope.</li> <li>- suction: connector and catheter.</li> <li>- gauze.</li> </ul> </li> <li>ii. lower shelf:                 <ul style="list-style-type: none"> <li>- N/Saline 0.9% - 10ml.</li> <li>- IV Lignocaine 2%.</li> <li>- alcohol 70% solution.</li> <li>- lubricating gel.</li> <li>- catheter mount.</li> <li>- sterile glove – appropriate size.</li> </ul> </li> </ol> </li> </ol>

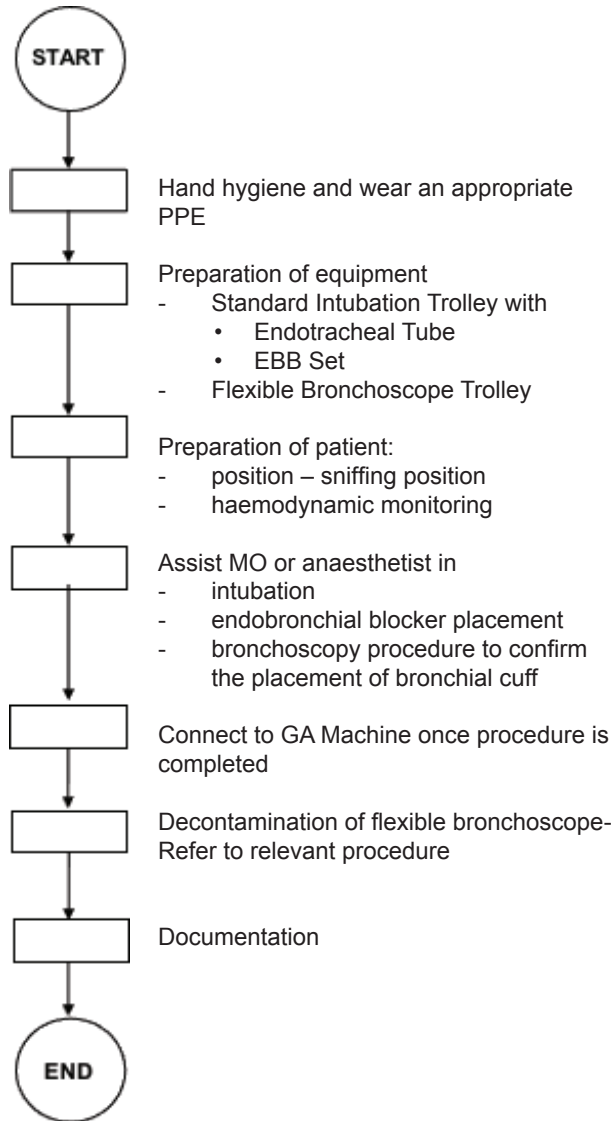

**Work Process**

1. Hand hygiene.
2. Wear an appropriate PPE.
3. Instruction receives from anaesthetist.
4. Preparation:
  - i. standard intubation trolley with appropriate size of double lumen ETT.
  - ii. GA machine - refer to relevant procedure.
  - iii. patient:
    - place patient in sniffing position.
    - monitor haemodynamic patient closely.
  - iv. preparation of flexible bronchoscope:
    - flexible bronchoscope sterilised.
    - check tip movement.
    - suction functioning.
    - light source attached and operational (where applicable).
    - ensure correct orientation of flexible bronchoscope.
    - defog tip of scope and white balance (where applicable).
    - focus the eyepiece or monitor on some written words to confirm integrity of image.
    - set up all equipment of bronchoscope and connect to system.
5. Assist MO or anaesthetist in:
  - i. administering anaesthetic drugs prior to intubation.
  - ii. intubation.
  - iii. connect to GA machine.
6. Assisting anaesthetist during bronchoscope procedure to confirm the placement of bronchial cuff:
  - i. hand over flexible bronchoscope to anaesthetist.
  - ii. assist anaesthetist in adjusting the position of bronchial cuff tube when needed.
  - iii. monitor patient's haemodynamic parameter while anaesthetist doing the procedure.
7. Decontamination of flexible bronchoscope - refer to relevant procedure.
8. Documentation

(DOUBLE LUMEN ENDOTRACHEAL TUBE)**

**B.14(b). ASSISTING IN ONE LUNG VENTILATION  
(Endobronchial Blocker)**

<b>Scope</b>	Assistant Medical Officers are responsible in preparing and assisting in one lung ventilation.
<b>Purpose</b>	To allow ventilation of only one lung to facilitate surgery.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. SSSL form.</li> <li>3. GA form.</li> <li>4. Surgical consent.</li> <li>5. Anaesthesia consent.</li> <li>6. High risk consent (where applicable).</li> <li>7. GA machine.</li> <li>8. Physiological monitoring system.</li> <li>9. Intubation trolley with the following:             <ol style="list-style-type: none"> <li>i. ETT.</li> <li>ii. EBB set:</li> <li>iii. syringe: 3ml and 5ml.</li> </ol> </li> <li>10. Flexible bronchoscope trolley – sterile preparation:             <ol style="list-style-type: none"> <li>i. upper shelf:                 <ul style="list-style-type: none"> <li>- flexible bronchoscope with monitor.</li> <li>- suction: connector and catheter.</li> <li>- gauze.</li> </ul> </li> <li>ii. lower shelf                 <ul style="list-style-type: none"> <li>- N/Saline 0.9%.</li> <li>- IV Lignocaine 2%.</li> <li>- alcohol 70% solution.</li> <li>- lubricating gel.</li> <li>- catheter mount.</li> <li>- sterile glove – appropriate size.</li> </ul> </li> </ol> </li> </ol>

**Work process**

1. Receive instruction from anaesthetist.
2. Hand hygiene.
3. Wear an appropriate PPE.
4. Preparation:
  - i. intubation trolley with EBB set
  - ii. GA machine.
  - iii. patient:
    - place patient in sniffing position.
    - monitor haemodynamic patient closely.
  - iv. preparation of flexible bronchoscope:
    - flexible bronchoscope.
    - check tip movement.
    - suction functioning.
    - light source attached and operational (where applicable).
    - defog tip of scope and white balance (where applicable).
    - focus the eyepiece or monitor to confirm integrity of image.
    - set up all equipment of bronchoscope and connect to system.
5. Assist anaesthetist in:
  - i. administering anaesthetic drugs prior to intubation.
  - ii. intubation.
6. Assist anaesthetist in EBB placement:
  - i. the bronchial blocker is passed through its port and placed at the entrance of the tracheal tube.
  - ii. the bronchoscope is passed through its port and then through the wire loop at the end of the bronchial blocker.
  - iii. the bronchoscope and bronchial blocker are then passed under direct vision as a single unit into the main bronchus of the operative side.
  - iv. the bronchoscope is withdrawn into the trachea, and the balloon is inflated under direct visualization.
  - v. when correct placement has been confirmed, remove the wire loop.
  - vi. connect to GA machine once procedure is completed.

## C.2. IDENTIFYING ERRORS AND TROUBLESHOOTING VENTILATORS

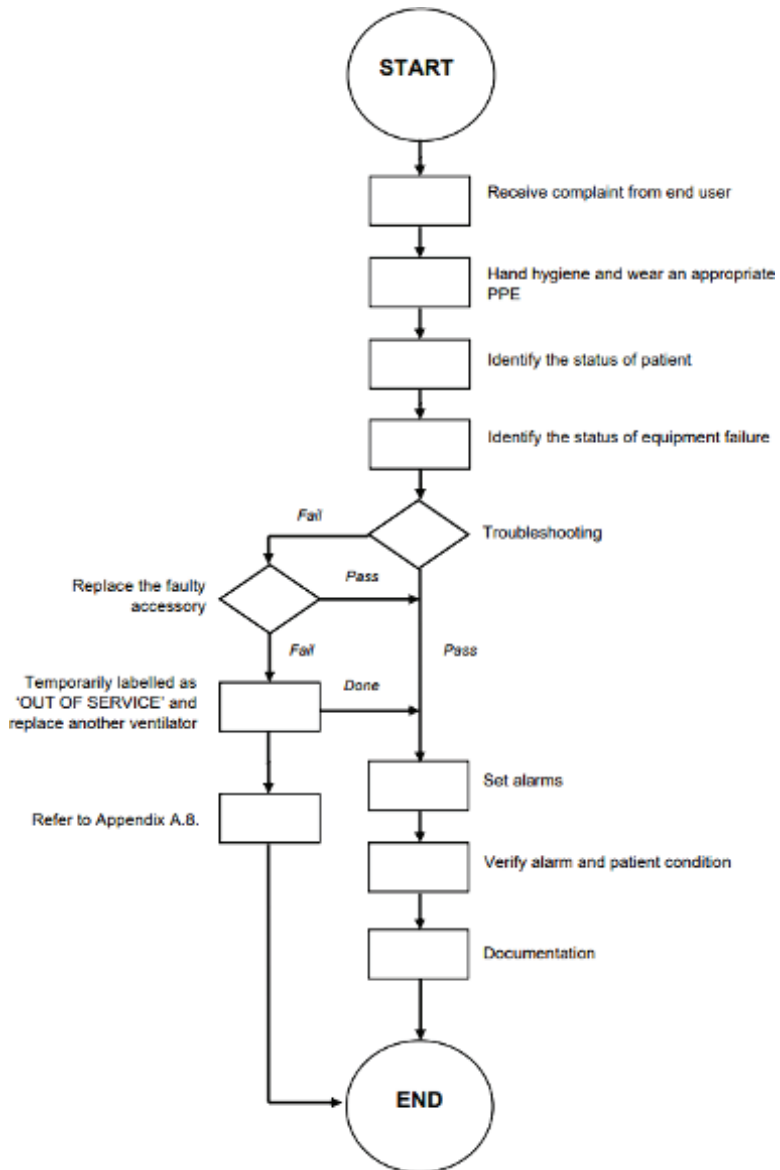

<b>Scope</b>	Assistant Medical Officers are responsible to inspect, identify and troubleshoot ventilators and inform HSS when it's malfunction.
<b>Purpose</b>	To ensure ventilators are functioning well and safe to be used on patients.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Test lung.</li> <li>3. Consumables or accessories.</li> <li>4. User manual (according to manufacturer).</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Receive complaint from end user.</li> <li>2. Hand hygiene.</li> <li>3. Wear an appropriate PPE.</li> <li>4. Identify the status of patient: <ol style="list-style-type: none"> <li>i. vital signs.</li> <li>ii. hemodynamic stability.</li> <li>iii. biohazard / normal.</li> </ol> </li> <li>5. Identify the status of equipment failure: <ol style="list-style-type: none"> <li>i. if the cause of an alarm cannot be identified and fixed quickly, remove the ventilator breathing circuits from the patient and begin manual ventilation with a BVM.</li> <li>ii. some essential alarms on the ventilator include ventilator inoperative, power failure, no gas delivery to the patient, low peak inspiratory pressure, low tidal volume, low or high minute volume, low positive end-expiratory pressure and continuous positive airway pressure, apnoea, inspiratory: expiratory ratio, high pressure limit, high respiratory rate, and low or high FiO<sub>2</sub>.</li> <li>iii. consumables faulty.</li> <li>iv. connection faulty (leak, loose, crack, sedimentation)</li> <li>v. display faulty (jammed, reboot faulty, no power supply).</li> </ol> </li> </ol>

<p><b>Work Process</b></p>	<ol style="list-style-type: none"> <li>6. Turn the ventilator off and restart it.</li> <li>7. Follow the troubleshooting instructions on the ventilator, if available.</li> <li>8. If the ventilator fails to operate properly, temporarily label it "OUT OF SERVICE" for a maintenance check and replace it with another ventilator.</li> <li>9. Ensure that the alarms are set appropriately.</li> <li>10. Verify the alarm has been corrected and the patient is in stable condition.</li> <li>11. Rectify the fault by troubleshooting according to the manufacturer user manual.</li> <li>12. Replace the faulty accessory, if available.</li> <li>13. If problem persist, refer to Appendix A.8.</li> <li>14. Documentation.</li> </ol>

**C.3. CHANGING OF DIRTY OR SOILED VENTILATOR CIRCUITS**

<b>Scope</b>	Assistant Medical Officers are responsible to ensure ventilator circuits are discarded or changed when soiled OR upon request by MO or specialist to change type of humidification from passive humidification to active humidification or vice versa.
<b>Purpose</b>	To prevent any microorganism growth and to facilitate change process on patient's humidification.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Breathing circuit.</li> <li>3. Test lung.</li> <li>4. HME.</li> <li>5. BVM.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. Wear an appropriate PPE.</li> <li>3. Receive instruction from MO or specialist on changing patient humidification from passive to active or via versa OR change circuits if soiled.</li> <li>4. Monitor patient haemodynamic status.</li> <li>5. Prepare accessories. (heated water bath, HME &amp; circuits).</li> <li>6. Pre-oxygenate patient 100%.</li> <li>7. Manual hand bagging with BVM .</li> <li>8. Disconnect inspiratory and expiratory circuit limbs.</li> <li>9. Change circuit : <ol style="list-style-type: none"> <li>i. discard soil circuit and change to clean circuits OR</li> <li>ii. discard HME and apply active humidification system OR</li> <li>iii. disconnect active humidification system and connect with HME.</li> </ol> </li> <li>10. Perform self-test or calibrate for circuit compliance and test for any leaks.</li> <li>11. Reconnect new circuit to patient.</li> <li>12. Recheck patient haemodynamic status.</li> <li>13. Documentation.</li> </ol>

**C.4. REPROCESSING OF VENTILATORY EQUIPMENT**

<b>Scope</b>	Assistant Medical Officers are responsible in reprocessing of ventilatory equipment according to the manufacturer protocols and hospital infection control guidelines.
<b>Purpose</b>	To allow safe use of ventilators which includes cleaning, disinfection, sterilization as well as testing and calibration.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Ventilators – invasive and non-invasive.</li> <li>3. Test lung.</li> <li>4. Disinfectant wipes or spray.</li> <li>5. Dressing trolley.</li> <li>6. Sterile sheet (for reusable circuit).</li> <li>7. Ventilator circuits (reusable).</li> <li>8. Reusable inspiratory and expiratory filter.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Reprocessing: <ol style="list-style-type: none"> <li>i. hand hygiene.</li> <li>ii. wear an appropriate PPE.</li> <li>iii. remove all accessories from ventilator.</li> <li>iv. keep aside all reusable patient circuits, inspiratory filter, expiratory filter, flow sensor, transducer cassette etc for thermal disinfection or cold sterilisation.</li> <li>v. remove and discard all disposable items.</li> <li>vi. wash and rinse all soiled items with distilled sterile water.</li> <li>vii. thermal disinfection for heat-resistant equipment that can withstand high temperature (e.g., 80°C); using a washer disinfector machine.</li> <li>viii. cold sterilization is performed if a washer disinfector is not available and for equipment that may not tolerate 80 °C or may be damage in physical appearance by high temperature.</li> <li>ix. once thermal or cold sterilization complete, rinse and dry it in drying cabinet.</li> <li>x. wipe ventilator surface with non-alcohol base disinfectant wipes.</li> <li>xi. allow ventilator surface to dry.</li> </ol> </li> </ol>

<p><b>Work Process</b></p>	<p>2. Performance test:</p> <ol style="list-style-type: none"> <li>i. fix the ventilator circuits and humidifier (if needed) to the ventilator.</li> <li>ii. connect flow sensor and do calibration for flow and oxygen sensor (if applicable).</li> <li>iii. run test and calibration on ventilator (as recommended by manufacturer guideline).</li> <li>iv. set the ventilator in normal range value. (normal range value refers to manufacturer operator manual).</li> <li>v. test run the ventilator with test lung within 15 - 30 minutes.</li> <li>vi. troubleshoot if any alarms and refer to Appendix A.8. if problem persist.</li> <li>vii. switch off ventilator once test ended.</li> <li>viii. storage.</li> </ol> <p>3. Documentation.</p>

## FLOW CHART REPROCESSING OF VENTILATORY EQUIPMENT

**C.5. PREPARATION AND SETTING UP VENTILATOR BEFORE USE ON PATIENT**

<b>Scope</b>	Assistant Medical Officers are responsible in preparation of disposable or reusable circuits, testing, calibration and performance test on ventilator before use on patient.
<b>Purpose</b>	To help increase the shelf life, performance, accuracy and efficiency of ventilator to prevent any errors and adverse effects and patient safety which are associated with ventilator.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Ventilator.</li> <li>3. Test lung.</li> <li>4. Dressing trolley.</li> <li>5. Sterile sheet (for reusable circuit).</li> <li>6. Ventilator circuits (Disposable / Reusable).</li> <li>7. BVF (inspiratory and expiratory limbs) – if applicable.</li> <li>8. Catheter mount.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. Wear an appropriate PPE.</li> <li>3. Connect the breathing circuit to ventilator (reusable/ disposable), BVF &amp; swivel catheter mount.</li> <li>4. Connect the ventilator to: <ol style="list-style-type: none"> <li>i. oxygen outlet.</li> <li>ii. medical compressed air outlet.</li> </ol> </li> <li>5. Switch ON ventilator.</li> <li>6. Perform ventilator system self-test or patient circuit test (if required).</li> <li>7. Follow manufacturer instructions for self-test as prompted.</li> <li>8. If self-test passed, cover or wrap the catheter mount and keep for a new patient or standby at bedside.</li> <li>9. If self-test fail, perform troubleshoot and if equipment still malfunction, refer to Appendix A.8.</li> <li>10. Documentation.</li> </ol>

**FLOW CHART PREPARATION AND SETTING UP VENTILATOR FOR A NEW PATIENT**

### C.6. PREPARATION AND ASSISTING IN PULSE INDEX CONTOUR CARDIAC OUTPUT MONITORING (PiCCO)

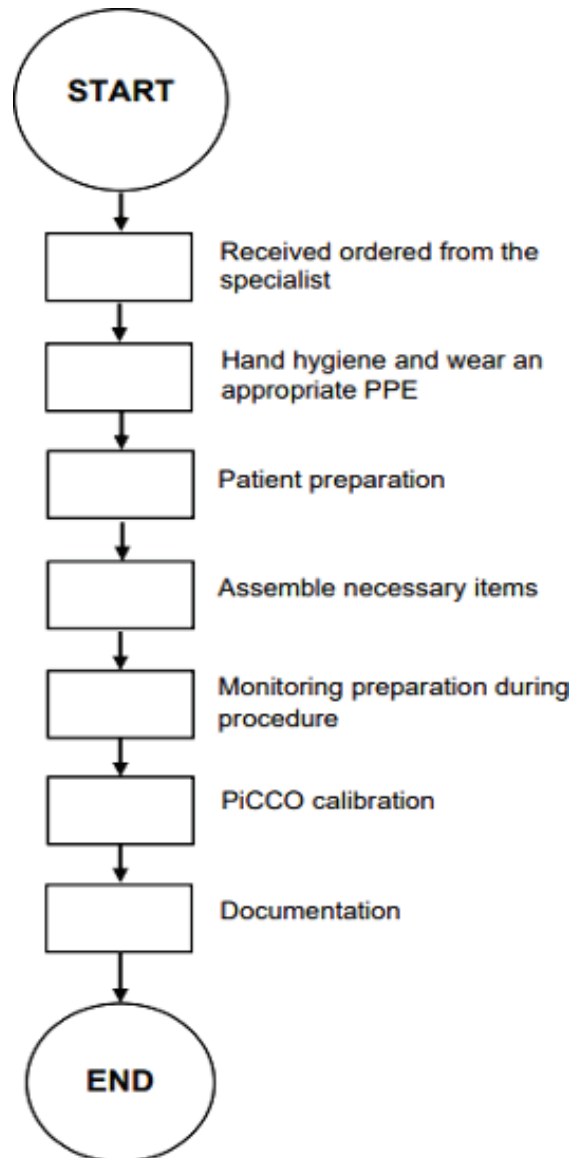

<b>Scope</b>	Assistant Medical Officers are responsible to facilitate and assist intensivist or specialist for accurate quantification of CO or at least precise detection of the change in the CO in critically ill patient.
<b>Purpose</b>	To assess and monitor cardiovascular status and to evaluate patient response to various therapies, including fluid management interventions, vasoactive and inotropic medication administration, and mechanical assist devices.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. PiCCO monitor with module.</li> <li>3. PiCCO monitor interface cable .</li> <li>4. Injectable temperature sensor cable.</li> <li>5. PiCCO catheter- 5Fr x 20 / 25cm.</li> <li>6. PiCCO monitoring kit.</li> <li>7. 3-way stopcock.</li> <li>8. Non-compliance tubing 200cm-red.</li> <li>9. Non-compliance tubing 200cm-blue (if applicable).</li> <li>10. IV pole and transducer holder.</li> <li>11. Pressure bag.</li> <li>12. CO module and cable for interface with the monitor.</li> <li>13. Pressure module and cable for interface with the monitor.</li> <li>14. N/Saline 0.9%.</li> <li>15. Levelling device (low-intensity laser or carpenter level).</li> <li>16. Sterile and non-sterile gloves.</li> <li>17. Syringes – 10ml and 20ml.</li> <li>18. Dressing sets.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Received order from the intensivist or specialist.</li> <li>2. Hand hygiene and wear an appropriate PPE.</li> <li>3. Patient preparation:             <ol style="list-style-type: none"> <li>i. patient verification.</li> <li>ii. assist the patient to the supine position.</li> </ol> </li> </ol>

**Work Process**

4. Assemble:
  - i. attach module, cable to monitor, drip set and cold saline.
5. During procedure : once PiCCO catheter inserted:
  - i. attach pressure transducer (ABP).
  - ii. once reading is acceptable, attach the temperature cable.
  - iii. attach CVP monitoring.
  - iv. attach injectate temperature sensor with housing cable.
  - v. check patient temperature reading:
    - enter patient data-name, gender, height or weight for body surface area.
    - levelling and zeroing ABP.
    - levelling and zeroing CVP.
6. PiCCO calibration:
  - i. key in CO mode.
  - ii. press start on "CCO or CO" module.
  - iii. once "message ready for measurement" appear - inject.
  - iv. 20cc cold saline (<8°C) when reading show "stable baseline, inject now".
  - v. perform rapid and smooth injection.
  - vi. perform minimal 3 reading of measurement to get the average.
  - vii. press save and calibrate CCO to store average values.
  - viii. press calculates haemodynamic.
  - ix. press vital sample and perform calculation.
  - x. calibration done and print result.
  - xi. make sure all parameters for CCO are functioning (CO, CI, SV, SVI, GEDV, GEDI, ITVB, ITVI, SVV, SVRi, SVR, CFI, EVLW, ELWI).
7. Documentation.

**FLOW CHART PREPARATION AND ASSISTING IN ANTICIPATED  
DIFFICULT ENDOTRACHEAL INTUBATION**

### C.9. PREPARATION AND ASSISTING IN FLEXIBLE BRONCHOSCOPY PROCEDURE

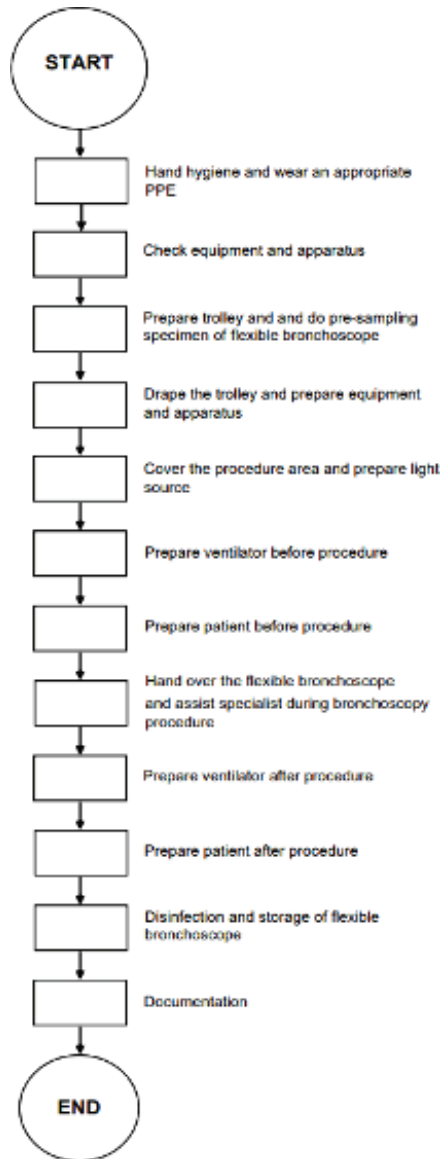

<b>Scope</b>	Assistant Medical Officers are responsible to prepare, assist and reprocessing of flexible bronchoscope according to hospital infection control guidelines.
<b>Purpose</b>	To obtain tissue specimen, assessment, diagnostic and therapeutic purpose, BAL, remove secretion and blood from patient with respiratory disease.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE.</li> <li>2. Flexible bronchoscope.</li> <li>3. Light source.</li> <li>4. Sterile dressing towel.</li> <li>5. Disposable suction set.</li> <li>6. Suction connector tubing.</li> <li>7. Syringe: 10ml.</li> <li>8. Sterile distilled water in 10ml.</li> <li>9. Sterile mucous extractor 10ml bottle.</li> <li>10. Lubricant jelly.</li> <li>11. Swivel connector with bronchoscopic port or endoscopic mask (optional).</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Pre-procedure:             <ol style="list-style-type: none"> <li>i. hand hygiene.</li> <li>ii. wear an appropriate PPE.</li> <li>iii. check equipment and apparatus.</li> <li>iv. prepare trolley for procedure.</li> <li>v. drape the trolley with sterile dressing towel.</li> <li>vi. do pre-sampling specimen by flushing the bronchoscope with sterile distilled water into the sampling container.</li> <li>vii. upper shelf;                 <ul style="list-style-type: none"> <li>- flexible bronchoscope flushed with s t e r i l e distilled water.</li> <li>- cover the procedure area with sterile dressing towel.</li> <li>- fill sterile distilled water in a gallipot of disposable suction set.</li> </ul> </li> </ol> </li> </ol>

**Work Process**

- connect suction tubing to the suction connector of the fiberoptic bronchoscope.
  - lubricate the fiberoptic bronchoscope with lubricant jelly.
  - draw 10ml of sterile distilled water by using syringe 10ml (standby for flushing purpose).
- viii. lower shelf;
- sterile distilled water in 10ml.
  - sterile mucous extractor 10ml bottle for BAL specimen.
  - lubricant gel.
- ix. switch on light source of bronchoscope.
2. Intra procedure:-
- i. ventilator:
- set ventilator setting and adjust parameter as per order by specialist.
  - pre-oxygenation with 100% of oxygen.
  - connect the swivel connector to 'Y' connector of the ventilator circuit. Lubricate orifice of the swivel connector (if needed).
- ii. patient:
- flat the bed and patient in supine position.
- iii. flexible bronchoscope:
- flush device with syringe 10ml with 70% alcohol before flushing it with N/Saline irrigation.
  - hand over the fiberoptic bronchoscope to specialist.
  - closely monitor any changes of patient vital sign.
  - perform chest percussion or vibration if needed.
  - connect the sterile mucous extractor to the suction port of the bronchoscope and get ready to flush with sterile distilled water to get the BAL specimen (if needed).

<p><b>Work Process</b></p>	<p>3. Post procedure:</p> <ul style="list-style-type: none"> <li>i. ventilator: <ul style="list-style-type: none"> <li>- set ventilator back to patient previous ventilator setting.</li> <li>- disconnect the swivel connector and connect back to ventilator circuit.</li> </ul> </li> <li>ii. patient: <ul style="list-style-type: none"> <li>- closely monitor vital signs.</li> <li>- position patient with head up 30 degrees.</li> </ul> </li> <li>iii. flexible bronchoscope: <ul style="list-style-type: none"> <li>- flush through the bronchoscope suction port with sterile water and wipe bronchoscope body with disinfectant wipes to remove patient secretion.</li> <li>- please handle the system with care and do not bend it.</li> <li>- soak in HLD solution (according to manufacturer recommendations).</li> <li>- rinse with clean water about 15 – 30 minutes.</li> <li>- hang in the drying cabinet about 30 – 45 minutes.</li> <li>- once dried, store in brief case or dedicated cabinet.</li> </ul> </li> </ul> <p>4. **FLOW CHART PREPARATION AND ASSISTING IN METERED DOSE INHALER**

#### C.14. PREPARATION AND MANAGEMENT OF PORTABLE MEDICAL OXYGEN GAS CYLINDER

<b>Scope</b>	Assistant Medical Officers are responsible in managing, checking and storage of portable medical oxygen gas cylinders.
<b>Purpose</b>	To ensure portable medical oxygen gas cylinders are always sufficient and safe to be used for both patient or HCW during intra or inter facilities transportation and disaster.
<b>Materials / Equipment</b>	<ol style="list-style-type: none"> <li>1. PPE – leather glove &amp; safety boots.</li> <li>2. Oxygen cylinder.</li> <li>3. Cylinder wrench.</li> <li>4. Pin index or bull nose oxygen regulator.</li> <li>5. Oxygen trolley.</li> </ol>
<b>Work Process</b>	<ol style="list-style-type: none"> <li>1. Hand hygiene.</li> <li>2. Wear an appropriate PPE.</li> <li>3. Position the cylinder upright in a cylinder trolley.</li> <li>4. Remove the protective cap or shrink wrap plastic tape protecting the cylinder valve.</li> <li>5. Identify the proper regulator according to pin index safety system.</li> <li>6. Pin index regulator to pin index valve cylinder or bull nose regulator to bull nose valve cylinder.</li> <li>7. Inform to personnel or patients in the area that a loud hissing noise will occur (if applicable).</li> <li>8. Position the cylinder such that the cylinder valve opening is pointing away from any people in the room.</li> <li>9. Check the cylinder by quickly opening and closing the cylinder valve by using a cylinder wrench.</li> <li>10. Check the pressure gauge to ensure the cylinder is full (2,000 psi) or not below 1/3 third of full capacity.</li> <li>11. Check for leakage at the connection between the cylinder and regulator.</li> <li>12. Listen for a hissing sound to detect any leakage.</li> </ol>

<b>Work Process</b>	<p>13. Feel for gas flow with your hands around the connection to detect any leakage.</p> <p>14. Turn on the flow meter and feel for the flow of gas.</p> <p>15. Turn off the flow meter after all system functioning well.</p> <p>16. Turn off the cylinder valve if cylinder is not in use.</p> <p>17. Place cylinder in a safe designated area.</p> <p>18. Documentation.</p>

**FLOW CHART PREPARATION AND MANAGEMENT OF PORTABLE MEDICAL OXYGEN GAS CYLINDER**

The page features a complex abstract graphic design on the left side, composed of various overlapping geometric shapes in shades of yellow, green, and orange. These shapes include circles, semi-circles, squares, and rounded rectangles, some with cutouts or internal patterns. The word "GLOSSARY" is centered in the middle of the page in a bold, black, sans-serif font. The background is white, and the overall aesthetic is clean and modern.

## **GLOSSARY**

ITEM	EXPLANATION/ DEFINITION
<b>Anaesthetic machine</b>	A medical device used to generate and mix a fresh gas flow of medical gases and inhalational anaesthetic agents for the purpose of inducing and maintaining anaesthesia.
Anaesthesia	General anaesthesia: controlled unconsciousness during which you feel nothing. In local anaesthesia, only an area of your body is numbed and you can remain awake.
Anaesthetist	A doctor trained to give anaesthetic.
<b>Arterial Blood Gas</b>	Measures the amounts of arterial gases, such as oxygen and carbon dioxide. An ABG test requires that a small volume of blood be drawn from the radial artery with a syringe and a thin needle, but sometimes the femoral artery in the groin or another site is used.
Arterial line	A cannula put into an artery (often at your wrist). This measures your blood pressure continuously. Your anaesthetist can also take blood samples from it to measure your oxygen levels.
Aseptic Technique	Is a standard healthcare practice that helps prevent the transfer of germs to or from an open wound and other susceptible are on patient's body.
<b>Awake Flexible Bronchoscope Intubation</b>	Awake tracheal intubation involves placing a tracheal tube in an awake, spontaneously breathing patient, most commonly with flexible bronchoscope.
<b>Berman Airway</b>	Side channels enable use of suction catheters without obstructing the airway, allowing for additional air flow.
<b>Bispectral Index</b>	Used to monitor depth of anaesthesia.
<b>Breathing circuit</b>	To deliver oxygen and anaesthetic gases and eliminate carbon dioxide.

ITEM	EXPLANATION/ DEFINITION
<b>Bromage Score</b>	An accepted tool for the measurement of motor block. This scale assesses the intensity of motor block by the patient's ability to move their lower extremities.
<b>BURP Manoeuvre</b>	Applying backward, upward, rightward, and posterior pressure on the larynx (i.e., displacement of the larynx in the backward and upward directions with rightward pressure on the thyroid cartilage) for visualization of the vocal cord.
<b>Capnography</b>	The monitoring of the concentration or partial pressure of carbon dioxide in the respiratory gases. Its main development has been as a monitoring tool for use during anaesthesia and intensive care.
<b>Catheter</b>	A hollow flexible tube for insertion into a body cavity, duct, or vessel to allow the passage of fluids or distend a passageway. One use includes the drainage of urine from the bladder through the urethra.
<b>Cricoid Pressure</b>	Also known as the Sellick manoeuvre, is a technique used in endotracheal intubation to minimise risk of regurgitation.
<b>Critical care</b>	Critical care is the multidisciplinary healthcare specialty that cares for patients with acute, life-threatening illness or injury.
Central Venous Pressure Line	A soft tube that your anaesthetist puts into a vein (often in your neck) that ends up in the large vein taking blood to your heart. It is used to measure pressure in these veins and to give you medicines, fluids or food.
Deep Vein thrombosis	A blood clot that forms in a deep vein in your leg or abdomen.

ITEM	EXPLANATION/ DEFINITION
Defibrillator	A machine that uses an electric current to stop any irregular and dangerous activity of your heart.
<b>Diameter Index Safety System</b>	A set of engineering standards preventing users of compressed gases from linking pressurised gas holding tanks to the wrong hoses or tubing. The standards designate specific-sized connectors for each different medical gas.
Guedal airway	A curved plastic device put into your mouth when you are unconscious. This keeps the tongue from blocking your airway so allows you to breathe more easily.
<b>Heat and Moisture Exchanger</b>	A device that intended to replace the normal warming and humidifying functions of upper airways when these structures are bypassed during endotracheal intubation.
<b>High Flow Nasal Cannula</b>	Is a device that delivered 100% warmed and humid air on at a flow rate of up to 80 litres per minute through nose.
<b>Hypothermia</b>	Defined as a body core temperature below 35.0 °C (95.0 °F) in humans.
<b>Intensive Care Unit</b>	A specialized section of a hospital containing the equipment, medical and nursing staff, and monitoring devices necessary to provide intensive care.
<b>Intensivist</b>	A critical care physician whose medical practice is focused entirely on the care of critically ill and injured patients.
Laryngeal Mask Airway	A piece of anaesthetic equipment. This lets oxygen and anaesthetic gas pass easily to your lungs without needing to put an endotracheal tube into your trachea.
Laryngoscope	Equipment with a light for examining your larynx (voice box) so your anaesthetist can see where to put an endotracheal tube.

ITEM	EXPLANATION/ DEFINITION
<b>Luer lock</b>	Luer-lock connectors (female) are joined by means of a tabbed hub on the female fitting those screws into threads in a sleeve on the male fitting and attaches securely. Male luer lock connectors are available with integral lock rings or with rotatable features to allow you to position the tubing before assembly. This locking mechanism is used for applications that require a secure connection and also making leak-free connection.
<b>Magill Forceps</b>	Magill forceps are angled forceps used to guide a tracheal tube into the larynx or a nasogastric tube into the oesophagus under direct vision.
<b>Malignant Hyperthermia</b>	It is a genetic hypermetabolic muscle disease, the characteristic phenotypical signs and symptoms of which most commonly appear with exposure to inhaled general anaesthetics or succinylcholine (triggering agents).
<b>Minimum Alveolar Concentration</b>	The concentration of a vapour in the alveoli of the lungs that is needed to prevent movement (motor response) in 50% of subjects in response to surgical (pain) stimulus. MAC is used to compare the strengths, or potency, of anaesthetic vapours.
<b>Mucosal Atomizer Device</b>	Intranasal or intraoral mucosal atomization device delivers a mist of atomized medication that offers rapid absorption across mucosal membranes to the blood stream.
<b>Nasopharyngeal Airway</b>	A type of airway adjunct, a tube that is designed to be inserted into the nasal passageway to secure an open airway.
<b>Neuromuscular blocking agent</b>	A chemical agent that paralyses skeletal muscles by blocking the movement of neurotransmitter at the neuromuscular junction.
<b>Pathogens</b>	A bacterium, virus, or other microorganism that can cause disease.

ITEM	EXPLANATION/ DEFINITION
<b>Pharmacokinetic</b>	The study of time course of drug absorption, distribution, metabolism and excretion.
<b>Pin Index</b>	Safety system designed to ensure the correct gas is filled into the correct cylinder and that the cylinder will only connect to correct equipment.
<b>Scavenging system</b>	A system that actively removes anaesthetic gases mixture from operating theatre.
<b>Target Controlled Infusion</b>	Automates the dosing of intravenous drugs during surgery.
<b>Total Intravenous Anaesthesia</b>	Intravenous administration of anaesthetic agents to induce a temporary loss of sensation or awareness.
<b>Tracheostomy</b>	A tracheostomy is a stoma/ opening created on the anterior tracheal wall.
<b>Ventilator</b>	The ventilator can do all the breathing for the patient or it can assist the patient's own breathing. A machine that delivers oxygen to a patient's lungs to assist with the breathing process.
